Method for satisfying the energy demands of animals, esp. useful mammals, comprises feeding them with a fat (I) having m.pt. greater than the body temp. of the animal (I) is fed as particles of max. size 50 microns, either in dry form or as an emulsion. (I) is esp. a hydrogenated fat and makes up over 5% of the feed. The feeds themselves contg. (I) are also claimed. They can include mineral salts, vitamin mixts. starch and protein concentrates.

The fine particles of (I) are pref. made by the cold air-spray crystallisation method. A suitable feed compsn. comprises 98% of the (I)-contg. powder plus 2% silicic acid or other anticaking additive.

In this form larger amts. of fat can be fed without disturbance to the animals digestive processes. The particles of (I) pass through the stomach unchanged but are completely digested and resorbed in the small intestine. The method is useful for lactating cows to prevent ketosis. (6pp)

BRES/ ★ D13 76225 D/42 ★FR 2477-381
Installation for natural fermentation of cocoa nibs - in successive perforated tote bins which are mechanically handled throughout

BRESCHARD J M 07.03.80-FR-005848

(D16) (11.09.81) A23g-01/02

07.03.80 as 005848 (448NS)
Installation is for the mechanical handling of cocoa nibs during multi-stage, natural fermentation. The fermentation takes place in the bins of square, horizontal cross section having flat bases with drainage perforations. The installation comprises a succession of parallel, horizontal conveyor tracks with drainage channels extending longitudinally beneath the tracks. Filled bins are advanced intermittently along each track, the contents of each bin being tipped, at the end of one track, into an empty bin at the start of the next track. The emptied bin is recycled to the start of its own track. Prepn. of freshly harvested cocoa nibs ready for dispatch to factories producing cocoa powder and cocoa butter, etc. Comparatively inexpensive mechanisation of previously labour-intensive operations is obtd. The capacity of the installation is easily increased by lengthening the tracks and speeding up the bin pushers. (19pp)

ALFA ★ D13 76264 D/42 ★FR 2477-664
Valve to connect milking machine to milk manifold - and vacuum, can accommodate thermal strains without leaking

ALFA-LAVAL AB 07.03.80-SE-001789

P13 Q66 (11.09.81) A01j-07 F16k-11/08

06.03.81 as 004557 (448NS)

The valve is of the type comprising a valve body clamped to the manifold and a valve ball which is fitted into the box and can be turned relative to valve seat(s). The box now contains two diametrically opposed valve seats, one leading to the milk manifold and the other, pref. via a flexible pipe, to the vacuum line. The ball has an externally accessible socket into which an adaptor can be fitted. An angular movement of adaptor and ball connects the milk manifold valve seat and the vacuum line valve seat, via ball passages, to two adaptor pipes linked respectively to the milk and vacuum passages of a milking machine.

The adaptor can be connected and disconnected single handed. The complete assembly is hygienic and easily cleaned. (5pp)

14.02.80 as 017588 (5AS)

Process comprises adding (a) ionic high molecular substance (I) such as sodium cellulose glycolate and (b) acidic metaphosphate to the protein colloid. Used for treating protein colloid such as fruit milk drink, fermented milk drink, lactic acid bacteria drink, etc. Prior sepn. problems are avoided.

(I) is pref. sodium cellulose glycolate, sodium starch glycolate, sodium alginate, gum arabic, pectin, locust bean gum, guar

gum, hydroxypropyl guar gum, carrageenan, xanthane gum, etc. (3pp)

MOMI ★ D13 76877 D/42 ★ J5 6113-263
Highly nutritive gelatinous food mfr. - by adding oil and fat to food soln. contg. foaming protein(s), xanthan gum and/or tragacanth gum and gelling agent and emulsifying

MORINAGA & CO LTD 14.02.80-JP-016036

(07.09.81) A23d-05 A231-01/04

14.02.80 as 016036 (5WB)

Method involves adding oil and fat-contg. food in amt. 10-75 pts.wt. oil and fat, to gelatinous food soln. contg. (a) above 0.01 pt.wt. of at least one foaming proteins, xanthan gum and tragacanth gum and (b) above 0.05 pt.wt. gelling agent and emulsifying the mixt. The gelatinous food contains sugar and/or sugar alcohol 25-90 pts.wt. per 100 pts.wt. of the sum of oil and fat and soluble solids.

Pref. oil and fat-contg. food is salad oil, butter, peanut butter, almond paste, cacao mass, butter cream, chocolate, etc. and the foaming protein is soy bean protein, wheat protein, their partial hydrolysate, lactalbumin, egg white, etc.

When (a) is added to the gelatinous food soln., it can be easily emulsified and solidified even when adding large amt. of oil and fat. The obtd. gelatinous food has excellent taste and flavour. (4pp)

TANA ★ D13 76878 D/42 ★ J5 6113-284
Antioxidant for food, cosmetics, etc. - comprises extracts from rosaceae, Leguminosae, Ericaceae or Liliaceae

TANABE SEIYAKU KK 07.02.80-JP-014445

(07.09.81) A231-03/34

07.02.80 as 014445 (5WB)

The antioxidant contains the extract of leaf, stem, flower, fruit, bulb or seed of the plant belonging to Rosaceae, Leguminosae, Ericaceae or Liliaceae as effective ingredient.

Pref. for plant Rosaceae the 'ohshima-zakura' and 'somei-yoshino' can be used, for Leguminosae 'adzuki' bean, black soybean and large broad bean can be used, for Ericaceae 'hirado-tsutsuji' can be used for Liliaceae leek, onion, Welsh onion, garlic and chibou can be used. The plants are extracted with lower alkanol such as ethanol and by removing solvent from the extract solid or oily brown extract can be obtd. The extract is added in amt. 0.005-1% to food, cosmetic, etc.

The extract is safe and shows strong antioxidising property and can be prep'd. inexpensively. (4pp)

SANE ★ D13 76879 D/42 ★ J5 6113-285
Non-toxic preservative soln. - comprises homogeneous soln. of acetic acid, sodium acetate, alcohol and opt. phytic acid

SAN EICHEM IND KK 14.02.80-JP-017587

E19 (07.09.81) A231-03/34

14.02.80 as 017587 (5KB)

Preservative is the homogeneous soln. composed of (a) 100 pts.wt. acetic acid, (b) 5-80 pts.wt. sodium acetate, (c) 5-50 pts.wt. alcohol and opt. (d) 1-10 pts.wt. phytic acid. The preservative suppresses almost all microorganisms including bacteria, yeast, mould etc.

Acetic acid shows antiseptic effect on using together with sodium acetate. Phytic acid helps the antiseptic effect by inhibiting the promoting effect of metals in foods on the growth of microorganisms by its chelating action. As alcohol, ethanol, propyleneglycol, glycerin, sorbitol etc. can be used. The preservative can be applied by immersing food in the soln. for a short time, by mixing it in food material or by spraying the soln. uniformly on food. (3pp)

Concentrating raw full-cream milk by reverse osmosis - the
releasing pressure so as to avoid fat globule damage and the
lipolysis

NEDE INST ZUIVELOND 22.02.80-NL-001095

(16.09.81) A23c-01

22.02.80 as 001095 (1190RP)

The milk is taken from a storage vessel, pressurised by a high
pressure pump and passed (e.g. by pump) along membrane
modules from which the permeate is removed.

The pressure in the concentrate is thereafter released such that
damage to the fat globules is almost completely avoided
prevent soapiness due to fatty acid formation which results from
lipolysis by lipase activity promoted by such damage. The
pressure release is pref. effected such that the BDI value
remains below 1.0 milli-equiv. per 100 grammes fat. This value
indicates ml. N KOH to neutralise 100 g. fat as per previous
published instructions.

Process is used for concentrating raw full-cream milk, part
at farm, by reverse osmosis. (11pp)

 tter for seed potatoes - has drum with channels in which walls
 e designed for average dia. of tuber so that it rolls towards
 e and it cut in pieces
 POTATO IND RES INST 01.03.79-SU-734635
 (07.01.81) A23n-15
 03.79 as 734635 (29VE)

Device for cutting seed potato tubers, has drum (1) with channels
 ounted on a vertical shaft. Knives are located (5) in the
 annels. The seed potatoes are cut into equal parts, by making
 e channels in the form of profiled walls with a radius of
 rvature becoming less towards their mouths, which are located
 h a definite relationship of their radial position by 18-25 deg.
 e ratio of the length of the profiles to the average radius of the
 bers is 9-17. Each profiled wall has fixed (2) and movable (3)
 ts hinged together and spring loaded.

The potato tubers are fed by a conveyor to the centre of the
 um (1) where, under the effect of centrifugal and Coriolis
 rces, they are pressed against the wall (2); the coefft. of rocking
 ction on the potatoes is less than the coefficient of sliding
 ction. The potatoes move along the wall, reach the exit part (3),
 d roll to the centre of the wall. The tubers are oriented relative
 the knives in relation to the average diameter of the tuber
 lative to the wall length. Some of the tubers are cut into three or
 ore parts, depending on the speed of rotation. The precise
 utting mechanics are explained in depth, and the cutting is
 oked at both theoretically and practically. Bul.1/7.1.81. (3pp

 Press for fruit juice extrn. - has hollow semi-eccentric with drain
 mesh and perforated wedges around cylinder

ODESS FOOD TECH INS 22.03.79-SU-758753
 P71 (23.01.81) B30b-09/16 C12g-01/02

22.03.79 as 758753 (89VE)

The extrn. of juice from fruit is accelerated and the quality of
 must is improved by using press fitted with the hollow semi-
 eccentric (12) contg. a drain mesh in its zone of maximum radius.
 The pulp from hopper (1) is moved by feed auger (2) through the
 perforated cylinder (3) where the semi-eccentric (12) contributes
 to the generation of radial pressures.

The juice is expelled through perforations of the cylinder (3)
 and through the mesh of the semi-eccentric to collector (8) via
 tube (6) which moves in bearing (7). The juice-denuded pulp is
 conveyed by the flight of auger (2) under the hollow perforated
 wedges (14) set at an acute angle of 14-26 deg. to the tangent of
 auger (2). The resulting increase of pressure prevents backflow.
 Bul.3/23.1.81. (3pp Dwg.No.1)

 Sepg. substances coagulated by heat, from aq. media - esp.
 potato processing effluents using ultra filtration under pressure

WAFILIN BV 31.07.74-NL-010323
 (23.01.81) *DE2533-762 C02f-09

30.07.75 as 162161 (WD)

Small quantities of substances capable of being coagulated by
 heat are sepd. from an aq. medium such as the waste water from
 the process for mfg. starch flour from potatoes, by subjecting the
 effluent before heating, to ultrafiltration at a pressure of 5-10
 atm., so as to raise the protein content to a concn. of at least 4%
 and possibly as high as 6%.

The filtration may take place through membranes of a
 synthetic polymer in the form of tubes, and be broken off
 regularly for treatment with a disinfectant such as hypochlorite
 soln. The membranes have a permeation rate of 4 cm³/cm²/h
 and the concentrate obtd. is raised to 100-120 deg.C, possibly by

mixing with superheated steam, to be thereafter cooled to below 80 deg.C. Process frees the effluent from protein practically completely removing all risks of fermentation or other microbial activity. Bul.3/23.1.81 (2pp)

Deep-frying tank holds heated oil floating on cooled water - in
which solids detaching from food collect for easy removal
without burning

MACH MENZING ZONEN 19.02.80-NL-001007

X27 P28 (16.09.81) A21b-05/08 A47j-37/12

19.02.80 as 001007 (1190HM)

The deep-frying unit comprises an open tank (12) which contains
the oil or fat (28) and a heating element (21) to bring the oil to the
required temperature. A cooling element (17) is arranged at a
level below the heating element (in water (27) on which the oil
layer in the tank floats). Small pieces, which detach themselves
from the articles being fried, collect in the cooled water layer and
can be removed therefrom without being burnt in the hot oil.

The cooling element preferably has openings which allow the
said pieces to sink down. The bottom of the tank may be provided
with one or more funnel-shaped closable (14) outlets (13). Water
spray nozzles (24) may be arranged above the oil.

Deep drying whilst preventing oil deterioration due to burning
of small pieces detaching from articles being fried. The
arrangement eliminates the need for expensive oil filtration
equipment or frequent oil changes and simplifies the oil cleaning
procedure. (9pp Dwg.No.2)

HRI- ★ D15 75800 D/42 ★CH-625-425
Suspended particles removal from aq. soln. - by flocks of flocculants added to filtering aids

CHRIST TAG 22.07.77-CH-009128
(30.09.81) B01d-15 B01d-37/02 C02f-01/52
2.07.77 as 009128 (39HM)

Suspended substances are removed from aq. solns. by preparing flocks in a maturing tank by adding flocculants to inert organic or inorganic fibres of needles. The flocks have a size of 1-50 μ and are made by adding 0.1 to 3 wt.% of anionic, cationic or neutral flocculants to the inert filtering aids. These flocks are added to the flow of aq. soln. in metered amounts and assist to separate the suspended substances on a filter by absorption or filtration.

The flocculation of inert filtering aids such as kieselguhr, activated carbon powder, plastic fibres and granules by anionic, cationic or neutral flocculants produces flocks very economically. The flocks have a three-dimensional structure with embedded functional groups. Such flocks are stable and do not raise the salt content of water.

This improves the filtering efficiency and requires a minimum of material. The filter does not clog within a short time of operation. (3pp)

LONZ ★ D15 75805 D/42 ★CH-625-491
Reclaiming mercury from waste water - such as water obtd. in acetaldehyde mfr., by adding iron powder to convert mercury ions in water to metallic mercury

LONZA AG 10.12.76-CH-015551
J01 M25 (30.09.81) C02f-01/62 C07c-47/09
10.12.76 as 015551 (1144BZ)

Iron powder is added to the waste water, so that mercury present as ions is reduced to metallic Hg, which is recovered in a suitable separator. The treatment of the water with iron powder pref. occurs in either a stationary tank fitted with a stirrer, or in a row of cascade tanks. The metallic Hg is pref. removed by a centrifugal- or plate- separator. Before the water is treated with iron powder, and metallic Hg already present is pref. removed by suitable appts., e.g. a hydrocyclone. When a plate separator is used to reclaim Hg, the water leaving the separator is pref. fed through a sand filter.

As compared with earlier processes for reclaiming Hg, the present invention causes no blockage in the reclaiming plant, and the Hg obtd. can be re-used as a catalyst. (2pp)

Sewage aerator impeller - with specified shape of eye rim and contours of outer shell

VEB CHEMIEANLAGE LE 28.03.80-DD-219988
A88 (22.07.81) B01f-05/16 C02f-03/16
28.03.80 as 219988 (39HM)

The impeller of a surface aerator for use in aerobic sewage treatment has an eye which is bounded by a bulbous rim with a cross-sectional area, resembling the sector of a circle. The outer contours continue in a line with a curvature which becomes more flat towards the other end of the internal curved blades, at a rate specified by the Patent. The outer contours and the inner contours, carrying the blades, converge at an angle of 5-20 deg (10-15 deg). Its material is a synthetic resin or steel.

This has a beneficial effect on the fluid kinetics and improves both the energy utilisation factor and the oxygen input. No turbulence or wall detachment are caused. (8pp)

FAIR ★ D15 75838 D/42 ★DD-149-673
Crosslinking and chloromethylating vinyl aromatic (co)polymers - by suspending in sulphuric acid and reacting with monochlorodimethyl ether

VEB CHEMIEKOMB BITT 31.03.80-DD-220050
A13 B04 (22.07.81) C08f-08 C08f-257/02
31.03.80 as 220050 (952HM)

Vinyl aromatic polymers (I) esp styrene (co)polymers are simultaneously crosslinked and chloromethylated by suspending (I) in sulphuric acid opt contg an iron cpd as cocatalyst, adding monochlorodimethyl ether opt mixed with an inert medium in an amt of greater than 1 mol per mol (I) and a swelling period of 0.5-3 hrs reacting at constant temp or with stepwise or continuous increase in temp at 20-80 deg C.

Chloromethylated crosslinked (I) beads can be prep'd economically in high yields. Using an excess of dichlorodimethylether, which also acts as crosslinking agent, a substitution degree of practically 100% can be achieved without agglomeration. The prod is used for ion exchangers, selective adsorbents and solid carriers for peptide synthesis. (8pp)

ULTR- ★ D15 75882 D/42 ★DE 3012-294
Automatic sewage sampler - with contacts diverting supply and opening outflow on reaching set sample Vol.

ULTRA X GMBH 29.03.80-DE-012294
S03 (08.10.81) G01n-01/10
29.03.80 as 012294 (39)

An automatic sampler for liq., esp. sewage, is connected to the supply by a submersible pump with a delivery hose. Its outlet into the sampler vessel can be shifted on receipt of a signal from above a return pipe to inside the vessel. One contact is at the top of an overflow pipe which governs by its length the quantity of the sample, and the second contact is at the inlet to an outflow to a collector vessel. When the two contacts are linked by a liq. column, they cause the shifting of the supply pipe outlet and, after a time delay, the opening of a squeeze clip at the outflow.

This sampler can be used even for very small samples to provide automatically the desired amt., independent of the available transport system or liq. level and is without falsification by deposits. (15pp Dwg.No.2)

MOLL/ ★ D15 75939 D/42 ★DE 3012-885
Producing high flushing pressures in filter sectors - by aligned apertures permitting flow into one sector only

MOLL HG 31.03.80-DE-012885
J01 (08.10.81) B01d-29/38
31.03.80 as 012885 (1480HM)

Filters or other appts. for treating water and which periodically undergo reversed flow for flushing the clogged filter material are divided into sectors by means of partitions. Access to these sectors is through two concentric apertured sheets movable relative to each other. In one position, for normal operation, these sheets permit equal access to all sectors, but in a second reversed-flow position used for flushing, only the apertures leading to one sector at a time are left free, causing a considerable increase in flushing fluid pressure. The apertures sheets are rotated manually or mechanically until all the sectors have been flushed.

Used with appts. for cleaning or chemically treating drinking water, bath water, waste water, etc. The high pressure produced and desirable for fluidising the filter material etc. would otherwise require stronger pumps and piping. (7pp)

WABA- ★ D15 75952 D/42 ★DE 3018-088
Cleansing system for water treatment filter - with brief flushing treatments between longer full treatment

WABAG KRETZSCHMAR 08.04.80-DE-013033
J01 (08.10.81) B01d-23/24
08.04.80 as 013033 (1480HM)

A single or multilayer filter bed used for treating water is periodically flushed by water and possibly air passing through in counterflow in order to remove suspended particles, gas bubbles etc. Between the periodic treatment for completely cleaning the filter, which follow gradual clogging throughout the body of the filter, are interposed briefer flushing programmes, normally initiated by a specific drop in pressure measured at the filter surface.

Cleaning of the filter surface, which is readily clogged by larger particles, means the deeper flushing of the whole filter can be postponed. The surface flushing only takes up to about 20% of the time for complete flushing. Consumption of power, water and air is correspondingly less. The flushing programme may be initiated by factors other than pressure drop, e.g. by turbidity. (8pp)

Prodn. of N-carboxyalkan-aminoalkandiphosphonic acids, N-carboxyalkan-azacycloalkan-disphosphonic acids and N-carboxyalkan-aminoaryl-diphosphonic acids of formula

$R_1C(PO_3H_2)_2NR_2R_3$ (I)

is claimed.

R' is H, alkyl of formula $-(CH_2)_XCH_3$ in which X is 0-10, hydroxyethyl, carboxymethyl, Ph, N,N-bis-(carboxyalkyl) aminoalkyl, or methyl- or ethylphosphonic acid gp., or R' with R2 is a 3-5C alkylene gp. and forms an azacycloalkane ring contg. the gp. of formula.

$C(PO_3H_2)_2-N(R_3)$ (II)

R2 is H, Me or is a R3, or R2 with R' is a 3-5C alkylene gp. and forms an azacycloalkane ring contg. a gp. (II); and R3 is a carboxy-substd. unbranched alkyl gp. of formula $(CH_2)_mCOOH$ in which m is 1-12, a 2-carboxy-2,2-dimethylethyl gp. or a 1,2-dicarboxyethyl gp.

Process comprises are produced by heating (a) an aminoalkane-, azacycloalkane- or aminoarylalkane diphosphonic acid of formula

$R_1C(PO_3H_2)_2-NHR_4$

in which R4 is H or Me or R4 with R' is a 3-5C alkylene gp. and forms an azacycloalkane contg. a gp. (II), with (b) a corresp. (un)branched haloalkane carboxylic acid or halosuccinic acid (or their alkali-, alkaline earth- or alkali-heavy metal salts or esters) in mol. ratio of 1:1 to 1:3 in aq. medium at 50-160 deg.C and pH 4.0-12.0 until reaction is complete.

(I) are useful for treating aq. systems. (11pp)

Industrial wastes, e.g. from the food processing industry, are biologically treated in at least one aeration basin with activated sludge and a final clarifying basin, recirculating the sludge in the aeration basin. Microbes which cause a floating froth layer of sludge are destroyed by a centrifuge treatment in the circuit

run at up to 8000 rev/min and the froth is exposed to acceleration of up to 8g. Flocculants can be added at the inlet to the final clarifying basin.

This is a safe remedy against froth layers of sludge, caused by microbes. (5pp)

12.02.79 as 100396 (39TM) (G) AU-337626 DE2649756 FR222519 FR2249703 FR2357484 GB-442510 GB1484657 E(BE CH DE FR G IT NL SE)

An aeration tank for sewage is a long vertical cylinder (tower buried in the ground) with several large tubes near the periphery in which pumps create a descending flow. Several venturi shaped restrictions are arranged in each tube. The one nearest to the top has an access pipe for atmospheric air which is thereby admixed, and the next is coupled to a pipe carrying recycle activated sludge from the final clarifying basin.

The flow velocity below a venturi section exceeds the rising velocity of the gas bubbles. Several revolving turbulence producing impellers at different levels ensure that the bubbles retain a small size.

This reduces the power consumption to a minimum and raises the oxygen input efficiency. (8pp)

 03.80 as 005079 Div.ex.004635-29.2.80 (448NS)
 The digester is in the form of a vertical cylindrical vessel and is of the type which is provided with a feeding device for the injection of fresh manure and with means for discharging manure after fermentation. The vessel contains a vertical cylindrical chimney, pref. coaxial with the digester vessel. The upper and lower ends of the chimney are spaced from the upper and lower walls of the vessel. An annular space separates the exterior of the chimney from the interior of the vertical wall of the vessel. A mixing pump recycles fermenting manure from the lower end of the vessel and returns it into the top end of the chimney.
 Generation of methane gas by digestion of liq. manure which is converted to an inoffensive fertiliser. The digester is viable on an industrial scale because of its continuous, troublefree operation. This is enhanced by thorough homogenisation of the manure during fermentation. (12pp)

TEC-★ D15 76231 D/42 ★FR 2477-427
 Filtration of liq. contg. solids in suspension - where sandy material is added so high filtration speeds are obtd. with suspensions normally very difficult to filter (BR 15.9.81)
 STEC SOC TECHN ENTR 10.03.80-FR-005577
 J01 (11.09.81) B01d-37
 03.80 as 005577 (1144)
 The suspensions can only be filtered with difficulty, so a chemically-inert, sandy material with a min. grain size of 0.1 mm is added. The result is easy filtration and simple washing of the filter cake. The amt. of sandy material added pref. has a wt. equal to 20-90% of the initial solid matter in the suspension. The sandy material is pref. recovered from the filter cake by physical or chemical washing, and is then re-used for the filtration of more suspensions. Alternatively, part of the filter cake contg. the sandy material may be recycled. Very high filtration speeds can be obtd., which are faster than when synthetic flocculants are used. (9pp)

RAP★ D15 76238 D/42 ★FR 2477-522
 Treating manures by two stage anaerobic fermentation - followed by culturing in ponds with algae
 SOC NATELF AQUITAINE 07.03.80-FR-005248
 P13 (11.09.81) A01g-33 C02f-11/04 C05f-11/02
 07.03.80 as 005248 (1251BZ)
 Two-step process for complete purification treatment of organic-rich manures comprises first anaerobic fermentation in two stages with first (acidification) stage at 30-42 deg.C and pH 4.5-6.5 for 5-20 (12-20) days and second (methanation) stage at 48-60 deg.C and pH 6.8-8.3 (7.7-8.3) for 5-20 (5-10) days.
 In the second stage the diluted effluent is cultured in ponds with algae at ambient temp. for 3-10 days, and the final mixt. is then decanted to give a supernatant suitable for direct discharge. Pref. the effluent from the first step is diluted to a COD below 2g per l and the algal fermentation is carried out using unicellular green algae of which 80% are of the genus *Chlorella*.
 The method is esp. useful for treating effluent from intensive pig raising units. By using two anaerobic stages each optimised for a particular type of bacteria, the overall quality of purification is improved. Algae harvested from the second step

can be used as fertiliser; animal feed (or esp. feed additive) or as feedstock for the first-step fermenters. The methane generated can be used as fuel for running the process. (7pp)

Submerged filter bed for liquid waste treatment - with removable shelf stack providing tortuous downflow path

YAMATO SETSUBI KOJI 28.03.80-JP-039839

(14.10.81) C02f-03/06

07.10.80 as 032296 (295BZ)

A submerged-filter-beds tank includes a tank with a removable stack of horizontal irrigated shelves resting on support bars. The shelves include two intermeshing sets, each providing communication from one shelf to the underlying one, but with communication points of one set offset from those of the other to provide a zig-zag flow path.

An air lift pipe is incorporated in the two sets of shelves to remove foul waste liquid from the bottom to the top of the tank.

Used for the biological treatment of sewage and factory effluents. The stacks can be removed for maintenance. The operation is simple and running costs low yet having a high purification efficiency. (16pp)

TORO-★ D15 76422 D/42 ★J5 611
Phosphate ion in water microanalysis - by converting phosphate ion to molybdate blue, filtering with microporous regenerated cellulose membrane and measuring colour

TOYO ROSHI KK 05.02.80-JP-012015

A89 E36 J04 (01.09.81) G01n-21/25 G01n-31

05.02.80 as 012015 (173HM)

Minute phosphate ion concentration in water is determined by (1) converting phosphate ion in the water sample to molybdate blue in usual way; (2) filtering the sample containing molybdate blue with microporous regenerated cellulose to concentrate molybdate blue on the membrane; and (3) comparing colour (or reflection and/or transmittance) of the membrane surface with a calibration table (or curve) prepared with standard samples.

The method is used for analysing phosphate in environmental water. In contrast to microporous membrane of cellulose, the regenerated cellulose membrane is capable of adsorbing molybdate blue and permits concentration of the blue pigment by adsorption and filtration.

In an example water sample (containing about 0.2mg of phosphate) was placed into 1 l measuring flask, and neutralised with H₂SO₄. 110 ml of NH₄ molybdate solution and 5 ml of SnCl₂ solution were added, and distilled water added up to the mark. After standing for 15 minutes, the solution was filtered with regenerated cellulose microporous membrane, and the colour of the membrane was measured spectrophotometrically. (5pp)

 5.02.80 as 011996 (51PW)
 ethod comprises purifying used ion exchange resin using aq.
 ain. contg. 100-8000 ppm surfactant and 10-800 ppm of
 ypochlorite at pH 10-13.
 The hypochlorite is sodium, calcium, potassium hypochlorite.
 The surface active agent is sodium alkylbenzene sulphonate,
 odium alkyl sulphonate, sodium alkyl naphthalene sulphonate,
 odium polystyrene sulphonate, sodium polyacrylate, or
 olyoxyethylene alkylether.
 A selectively permeating cation exchange membrane and a
 electively permeating anion exchange membrane were
 alternately laminated. Sea water was electro dialysed through
 he resulting laminated membrane for 3 months. The resulting
 used membrane was washed with a soln. of sodium hypochlorite
 djusted with NaOH to pH of 11.0 to obtain a purified and
 egenerated membrane. (5pp)

 reating fire extinguishing foams contg. waste liq. - by adding
 eric and magnesium chloride, alkali, and coagulant to form
 flocs and then filtering
NITTAN KK 06.02.80-JP-014049
K01 (02.09.81) C02f-01/52
 6.02.80 as 014049 (34NS)
 urfactant- or protein-type foams fire-extinguishing agent-contg.
 aste liquor is subjected to flocculating treatment by adding
 FeCl₂ and FeCl₃, followed by alkali to adjust its pH to 10.5 to

generate flocs. Polymer coagulant is then added to increase the
 size of the flocs, which are then filtered by e.g. in vacuum pre-
 coating filter. The filtrate is neutralised with acid e.g. HCl and
 subsequently the treated water fed into a drainpipe etc.

MgCl₂ and FeCl₃ adsorb foaming components contained in the
 waste liquor. The filtrate is prevented from foaming caused by
 small amts. of foam-extinguishing agent.

In an example, 10,000 ppm of MgCl₂ and 2,000 ppm of FeCl₃ are
 added to a surfactant-type foams fire-extinguishing agent,
 followed by stirring. 5,000 ppm of NaOH are then added to adjust
 its pH to 10.5. 20 ppm of polymer coagulant were added (Sumifloc
 FA-50) to cause flocculation. The prod. was filtered and the
 filtrate neutralised with HCl aq. to pH 7. (5pp)

 Oxidising formaldehyde contained in waste water - using
 hydrogen peroxide, and a copper salt as reaction end point
 indicator

NIPPON ELECTRIC KK 07.02.80-JP-013920
E17 (02.09.81) C02f-01/72 G01n-31/22

07.02.80 as 013920 (34NS)

A Cu salt e.g. CuSO₄ etc is added to water followed by H₂O₂,
 while maintaining its pH at 8-12 until Cu suboxide is not formed.
 The treated water changes from orange yellow to dark green at
 the reaction end point. Addition of excess H₂O₂ is prevented and
 the process becomes very economical.

By previously adding the Cu salt to the waste water, Cu ion is
 oxidised to orange yellow-coloured Cu suboxide by nascent
 hydrogen. The Cu suboxide is converted to a dark green-coloured
 mixt of CuO and Cu(OH)₂. The amt of Cu salt added is pref
 greater than 10 (100-1000) mg/l. (2pp)

 COD value measurement - involves measuring chloride concn. in
 water to deduce amt. of potassium permanganate consumed by
 chloride in water

MATSUSHITA ELEC IND KK(KIMO-) 06.02.80-JP-014120
J04 (03.09.81) G01n-27/26 G01n-33/18

06.02.80 as 014120 (117RH)

COD value is obtd. measuring chlorine ion concn. in water
 sample to obtain the amt. of potassium permanganate consumed
 by chlorine ion, potassium permanganate is then added without
 silver salt to obtain the total amt. of the potassium permanganate
 consumed, the amt. of potassium permanganate consumed by
 the chlorine ion is deducted from the total amt. of the potassium
 permanganate to obtain actually measured value in case where
 no silver salt is added, the actually measured value for a test
 water with the same compsn. as the test water in case where
 silver salt is added is divided by the actually measured value for
 the case where no silver salt is added to obtain an oxidn. rate
 coefft., and then actually measured value for a test water in case
 where no silver salt is added is multiplied by the oxidn. rate
 coefft. to obtain COD value.

This measurement method for COD value can greatly reduce
 the amt. of silver salt used and also measuring cost as well as
 obtain easily COD value with high accuracy. (5pp)

 Determin. of total organic carbon in halogen ion contg. sample -
 esp. water, by burning sample on oxidising catalyst, contacting
 with metallic silver and measuring carbon di:oxide content

MITSUI PETROCHEM IND KK 12.02.80-JP-016308
J04 (05.09.81) G01n-31

12.02.80 as 016308 (173RP)

Total organic carbon (TOC) in halogen-ion-contg. sample is determined by (1) burning the sample on oxidising catalyst (e.g. Co oxide, Pt, Pd, etc.), (2) bringing the oxidised gas stream into contact with metallic Ag (or Co₃O₄) treated with inorganic acid, and (3) determining CO₂ content in the gas stream (pref. by non-dispersive IR analysis).

The method is used for determination of TOC in the environmental water samples. Noise caused by halogen ions is excluded by the treatment with Ag (or Co₃O₄) treated with inorganic acid. In an example, sea water (COD 7 ppm) was used as the sample. 20 microlitres of the sample was passed through a 18 mm dia. quartz glass tube packed with 12 g of Co₃O₄ (temp. = 900 deg.C) together with 180 ml/min of air. The oxidised gas stream was passed through a column packed with 30 g of Ag treated with boiling 35% hydrochloric acid for 2 mins. The gas stream was then led to a NDIR analyser. (5pp)

MITU ★ D15 76804 D/42 ★ J5 6112-910
Cation exchange resin mfr. - of crosslinked acrylic acid (ester) contg. sulphonic acid gps.

MITSUBISHI CHEM IND KK 13.02.80-JP-016268

A91 J01 (A14) (05.09.81) B01j-39/20 C08f-08/36

13.02.80 as 016268 (57BZ)

The cation exchange resin comprises crosslinked skeleton structure in which monofunctional cpd. with acrylic acid or its ester as the main body and polyfunctional cpd. are copolymerised and partial structure in which sulphonic acid gp. is bonded to carbon in alpha position of acrylic acid part of the skeleton.

Its mfg. process comprises sulphonating crosslinked copolymer of monofunctional cpd. with acrylic acid or its ester as the main body with polyfunctional cpd. As the polyfunctional cpd., divinyl benzene, divinyl toluene, divinyl naphthalene, etc. are cited.

As the cation exchange resin has skeleton consisting of crosslinked aliphatic carbon chain, it shows little organic contamination by protein, etc. Thus it is utilised for uses such as purificn. of amino acid, medicine, etc., treatment of waste water, etc. It has high heat resistance compared with the prod. on the market. It can be utilised as acid catalyst. (4pp)

26.02.73 as 023047 (WB)

Cr VI and/or complex Fe cyanides are virtually completely removed from aq. solns. contg. these by treating with an ionic cpd. A-X in which the anion X reduces the Cr(6+) to Cr(3+) and the cation A reacts with the complex cyanides to produce insol. cpds. Prefd. treatment agent A-X is zinc dithionite.

The treatment is esp. useful for ind. effluents e.g. from Al sheet treatment contg. chromic acid, potassium ferricyanide and HF. (J49067444) (10pp)

CHIY D15 71276 W/43 = J8 1039-957
Spent pickling liquor purifn - by addn of lime, oxidizing agent with subseq filtration

CHIYODA CHEM ENG CO 05.06.73-JP-062515
M12 (17.09.81) *J50010-780 + C02f-01/72
05.06.73 as 062515 (RP)

Spent pickling liquor is mixed with excess amt. of a Ca compd. and after adding anoxidising agent the spent pickling liquor is agitated and filtered to remove solid materials. The resulting filtrate is discharged after adjusting the pH to -7.0.

In an example 500 ml spent pickling liquor (COD 1500 ppm) contg. 5000 ppm Fe was mixed with 30 g lime, and then 6 wt.% bleaching powder was added. After agitating for 2.5 hr., the liquor was filtered to remove solid materials and mixed with HCl for the pH adjustment. The liquor thus treated had pH 8.0 and COD 5.5 ppm, and contained trace Fe. (J50010780) (2pp)

MITO D15 60849 B/33 = J8 1039-960
Biological treatment of waste water contg. dithionite acid and ammonia - using activated sludge contg. sulphate and nitrate ions, formed by use of thio: cyanogen as main nutrient source

MITSUBISHI HEAVY IND KK 21.12.77-JP-152869

10.03.75 as 028845 (TM)

An appts for exchange of material between two fluids comprises a housing enclosing a bundle of hollow fibres with permeable walls and means for passing the first fluid through the housing over the outer surfaces of the fibres whilst the other fluid flows through the internal passages in the fibres.

The novelty lies in the fact that the housing has a number of wall sections next to the bundle of fibres which are so shaped that they form enlargements in the crosssectional of the housing and cause the first fluid to flow transversely across the bundle of fibres.

The appts is used in artificial kidney and lung machines, for desalination of water, thickening of fruit juices, removal of sediment from beer etc.

By forcing the first fluid to flow transversely across the fibres, good mass transfer is achieved by the high velocities and boundary layer disturbance in the centre as well as the outer parts of the bundle. (J51103873) (98pp)

NITL D15 00662 B/01 = J8 1040-605
Semipermeable membrane with good water permeability and salt rejection - is prepd. using a swelling agent comprising urea, aliphatic mono- or di-carboxylic acid and/or their anhydride

16.01.80 as 112549 (295RH)

Liqs. are electrically treated using an appts. which comprises a first cylindrical electrode mounted for rotation about a horizontal axis coincident with the longitudinal axis of the electrode. Liq. is supplied to the upper peripheral surface of the electrode.

A second stationary electrode has a surface spaced from that of the first electrode. The two electrodes are held with their opposed surfaces a fraction of an inch apart to define a restricted gap which receives the liq. and reduces it to a thin layer to concentrate the effect of the electrodes. An electric field is produced across the gap. A stripper engages the surface of the rotating electrode at a point downstream of the gap to remove adhering liq. and other materials.

Used for treating waste water with an electric field which causes particulate matter in the liq. to flocculate and subsequently settle out. The electrocatalysis which occurs at the electrodes also helps to break down the effect on the waste

liq. (5pp Dwg.No.2)

Electro-catalytic sewage treatment unit - with surge tank to which sea water is delivered so unit can operate continuously

OMNIPURE INC 03.08.79-US-063581

(29.09.81) C02f-01/46

03.08.79 as 063581 (295RH)

A compact unit for the treatment of waste water includes an elongate electrocatalytic cell contg. between an inlet and an outlet closely spaced, vertical, parallel electrodes. The waste water flows upwardly through the cell.

The unit also includes a surge tank for the gravity sepn. of solids and for evening out the flow. There is a vent line from the surge tank. The tank discharges through a macerator to the electrocatalytic cell. Electrolyte is added to the water before entry to the cell. Water is introduced to the surge tank to maintain a relatively constant minimum flow so as to allow continuous operation of the cell even when there is no waste flow. The cell discharges to a closed effluent vessel with a stand pipe with a vent opening. A negative pressure is produced in the stand pipe.

Unit is designed for use on board ships. The discharge effluent is low in suspended solids and free of pathogenic organisms so that it may be directed into a body of water without risk of pollution. (7pp)

STAD ★ D15 77672 D/42 ★US 4292-176
Activated sludge treatment of waste water - with addn. of activated carbon with high surface area

STANDARD OIL CO (IND) 14.08.80-US-178139 (08.12.76-US-748553)

(29.09.81) C02f-03/08

14.08.80 as 178139 (295HM)

In an activated sludge process, a contaminated water is contacted with activated sludge in a first stage for a period to biologically degrade the contaminants. In a second stage the decontaminated water is sepd. from the activated sludge. A first portion of the sludge is recycled while a second portion is treated further.

The contaminated water is pretreated before entering the first stage so that it contains less than 20 ppm of hydrocarbons and less than 20 ppm solids. 1 to 40 ppm activated carbon with a zeta potential of at least -10 millivolts, is introduced into the water so that the carbon is present in the first and/or second stage. The average age of the sludge in the first and second stages is maintained in excess of ten days.

The method may be used for treating municipal or industrial waste. The method economically uses the activated carbon for the efficient treatment of the waste. (13pp)

E17 P43 (01.10.81) B09b C12m

01.06.81 as 889033 (1190RH)

The arrangement is intended for producing methane gas by fermentation of organic domestic refuse and recuperating heat generated in the process. It uses the principle described in BE-887957 but differs in that the operation is automated.

The complex comprises two or more reactors into which pre-sorted refuse is deposited by overhead cranes via hermetically closable doors. Already pre-sorted refuse in plastic bags pass a bag cutter before being introduced. A water pump is connected to a line with valves to inject water into the reactors. Developed gas rises via gas lines for storage in tanks on the roof of the complex. Digested refuse is removed from the bottom of the reactor via motorised dampers and pipes. All operations are controlled from a central point.

Automatically operating plant is provided with centralised remote control. (9pp)

Anaerobic slurry digester with capping - of interlocking elements with ballast tanks and gas release valves

COMMONWORK ENTERPRI 29.06.77-GB-027295 (28.03.80-EP-300972)

Q74 + P11 Q34 (07.10.81) *US4230-580 + A01c-03/02 B65d-88/76 C02f-03/28

28.03.80 as 300972 (NS) (E) GB1411659 GB-471003 DS-640367 GB-518353 E(AT BE CH DE FR IT LU NL SE)

An anaerobic slurry digester is capped by a set of elongated flanged members. Between pairs of caps are elongate tanks which rest on the cap flanges and serve as ballast when filled with water. The cap rises under gas pressure generated by the slurry. The caps are domed and excess gas is released from the domes.

The cap is of modular construction and can be tailored to fit a range of slurry tanks.

In an example, each cap element (ii) is semi-cylindrical and is terminated by horizontal flanges. Elongated water tanks rest on the flanges to bias the cap downwards. Pref. the cap is made of

concrete or plastic and sections may be removed to skim the slurry. Pref. the slurry tank has a lining of glass fibre reinforced acrylic-modified polyester resin e.g. 60% ester, 20% methylmethacrylate and 20% styrene. (25pp)

Specific antibodies are prepd. by contacting an antibody contg. body fluid with the corresp. antigenic peptide linked to an insoluble carrier and then eluting the absorbed antibody. The obtd. antibody is used in enzyme immunoassay. Beta-D-galactosidase or its conjugate with an immunoactive substance is stabilised by lyophilising its aq. soln. in the presence of a sugar or sugar alcohol. This is also used in enzyme immunoassay.

Human chorionic gonadotropin (HCG) is assayed by enzyme immunoassay using an antibody prepd. as in (A) in which the peptide is H-Ala-Pro-Pro-Ser-Leu-Pro-Ser-Pro-Ser-Arg-Leu-Pro-Gly-Pro-Ser-Asp-Thr-Pro-Ileu-Leu-Pro-Gln-OH. The enzyme can be beta-D-glucor alkaline phosphatase. Alternatively, when the peptide is H-Asp-Ser-Arg-Arg-Ala-Gln-Asp-Phe-Val-Gln-Trp-Leu-Met-Asn-Thr-OH pancreatic glucagon may be assayed.

Method can be used for diagnosis of pregnancy or HCG dependent tumours. (79pp)

(A) Autotrophic or methylotrophic bacterium comprising foreign DNA and capable of producing as a metabolite a prod. that in its unmodified state the organism would not produce is new.

(B) Autotrophic or methylotrophic bacterium comprising DNA capable of expression in the form of a metabolite that is biologically active in a different organism is new.

(C) Introduction of foreign DNA into an autotrophic or a methylotrophic bacterium is effected by using a plasmid of one of the incompatibility gps. N, P, Q or W, carrying the genetic material that it is desired to introduce into the bacterial cell.

(D) A composite plasmid obtd. by cleaving plasmid R300B and effecting ligation in presence of genetic particles derived from a different plasmid is new.

The foreign DNA is pref. eukaryotic DNA and is suitably mammalian, esp. human, DNA. The bacterium is pref. modified methylotrophic methylotrophus, but other known methylotrophs and autotrophic bacteria may be modified. The known techniques are used in the formation of the composite plasmid and for introducing DNA into the bacteria.

The modified bacteria are useful in the biosynthetic prodn. of the metabolites, which include insulin and human growth hormone as well as other hormones and antibiotics such as penicillins, the metabolites pref. being biologically active in mammals. (36pp)

 Carboxylic acids, salts and ester(s) of ML-236 and MB-530 - useful as cholesterol biosynthesis inhibitors

SANKYO KK 08.04.80-JP-046004
 B05 (14.10.81) A61k-31/21 C07c-57/26 C07c-59/46 C07c-69/60 C07c-93/19 C07c-143/68
 08.04.81 as 011061 (914KB)

Carboxylic acids, salts and esters of formula (I) are new. In (I) R1 is H or Me; R2 is H, an ester gp. or a cation; R3, R4 and R5 are H or an (in)organic acyl gp., provided that when R3 is 2-methylbutyryl then R4 and R5 are both acyl; and n is the valency of R2.

(I) inhibit the activity of 3-hydroxy-3-methyl glutaryl coenzymes A reductase, which is a rate-determining enzyme in the biosynthesis of cholesterol. Hence they may be used in the treatment of hypercholesterolaemia. They are pref. administered in the form of tablets or capsules in amt. 1-10mg. per day. (40pp)

HONS ★ D16 76366 D/42 ★ GB 2073-202
Restriction enzymes prodn. - by cultivation of Bifido bacterium, in DNA cleavage

YAKULT HONSHA KK 02.04.80-JP-043857

B04 (14.10.81) C12n-09/18

04.03.81 as 006851 (476NS)

Restriction enzymes are obtd. by cultivating a restriction enzyme-producing strain belonging to Bifidobacterium.

Restriction enzymes are endonucleases which recognise specific nucleotide sequences on double-stranded DNA and cleave it at or near the sequences, yielding unique fragments; and are useful in a wide variety of applications in DNA research. While many restriction enzymes of different specificity are known, it is still required to have novel specificities for further characterisation of DNA molecules and for construction of recombinant DNA molecules in vitro, and to have better sources of some of the known enzymes for practical purposes, and Bifidobacteria produce a variety of these enzymes with properties advantageous for practical use. Bifidobacteria are easy to grow on a large scale, and the enzymes can be purified straight forwardly because of their remarkable stability and the low level of interfering nuclease activities in the crude extracts. (6pp)

AZUC. ★ D16 76380 D/42 ★ GB 2073-244
Prepn. of Torula or Candida utilis suspensions - by cultivation in vinasse for animal feed supplement prod.

AZUCARERA ARGENTINA 00.00.80-GB-036168 (12.11.79-AR-278858)

C03 (D13) (14.10.81) A23k-01 C12n-01/16

11.11.80 as 036168 (1248KB)

Prepn. of suspensions of Torula or Candida utilis is effected by cultivation of the microorganism in vinasse in presence of NH₄ and P-contg. salts. The microorganism suspension is obtd. in good yields, and in a continuous process, high yields can be achieved at low cost, e.g. yields may be 6g/l/hr. compared with 0.99-3g/l/hr. in prior procedures. The prod. is a protein source for prodn. of animal feed supplements.

Pref. the fermentation is effected in a medium to which at least one cpd. of Mg, Mn, Zn, B, Cu, Co, Mo, I or Se has been added. When the process is operated continuously, a soln. of the cpd(s). is added to the medium. Pref. molasses is also added to the medium, together with chloramphenicol and formol, and H₂SO₄ to maintain pH 3 or below. The antibacterial and formol prevent bacterial and fungal contamination, and this is assisted at low pH. (3pp)

YEDA ★ D16 76381 D/42 ★ GB 2073-245
Bovine growth hormone from new strains of E coli - obtd. by recombinant DNA method

YEDA RES & DEV CO LTD 24.03.80-IL-059690

B04 C03 (14.10.81) C12n-15

24.03.81 as 009125 (476HM)

New strains of E. coli adapted to produce bovine growth hormone are obtd. by extracting RNA from bovine pituitaries, transcribing DNA on the resulting RNA templates, splicing the DNA into plasmids, inserting the spliced DNA into microorganisms and further subjecting the microorganisms to selection and isolating the colonies producing the desired fused or modified growth hormone. Such modified E. coli strains are cultivated and the desired modified BGH is recovered.

DNA is synthesised enzymatically on mRNA isolated from bovine pituitaries. The DNA is spliced into the beta-lactamase gene of a commonly used plasmid pBR322. E. coli cells, pref. of the HB101 strain, or of similar strains, are transformed by the recombinant plasmids and colonies contg. these plasmids are isolated. Colonies (clones) contg. the coding capacity for BGH and colonies contg. the coding capacity for prolactin are identified by DNA sequencing. The inserted DNA from a colony contg. the full length coding sequences for growth hormone is isolated and reinserted into another plasmid in a position adjacent to the beta-galactosidase promoter. Several colonies producing a polypeptide, which is characterised to be the desired growth hormone by gel electrophoresis and by pptn. with antiserum, raised in response to pure authentic BGH, are isolated. (5pp)

Irradiating vinyl monomer compsn. contg. bioactive material - and glutaraldehyde, to fix the bioactive material at low temp.

JAPAN ATOMIC ENERGY RES 12.02.80-JP-015762

A96 B04 (05.09.81) A61k-09/58 C08f-02/48

12.02.80 as 015762 (57NS)

Process comprises irradiating ionizing radiation to a system obtd. by adding glutar aldehyde to a mixt. consisting of bioactive substance and 1 or more different kinds of vinyl type polymerisable monomer.

Pref. 1-10 wt.% to the system of glutar-aldehyde is added. Pref. 1-10 wt.% w.r.t. the system, of vinyl type polymerisable monomer is used. Irradiation of ionizing radiation is pref. applied at 0-10 deg.C. As the vinyl type polymerisable monomer, ethylene glycol diacrylate, diethylene glycol diacrylate, polyethylene glycol diacrylate, butane diol diacrylate, etc. are pref. bioactive substance is used in the form of buffer soln.

The process can fix bioactive substance firmly in a (co)polymer copolymer without damaging its activity, at low temp. and in a short time. A comparatively low dose of ionising radiation is used. (4pp)

FUKO ★ D16 76881 D/42 ★ J5 6113-289
Beta-amylase extract concentration and refining - involves addn. of halogen free salt of calcium, magnesium or aluminium, and use of a membrane

FUJIOIL KK 09.02.80-JP-014992

B04 (07.09.81) C12n-09/26

09.02.80 as 014992 (965NS)

The method comprises adding a salt formed from calcium, magnesium or aluminium, and an anionic group free of halogen atom, to liquid beta-amylase extract and concentration-refining it using membrane. CaSO₄ calcium lactate, calcium citrate, magnesium lactate, magnesium acetate, aluminium acetate, aluminium borate, etc. are pref. used and they are pref. added above 0.01 (esp. above 0.1)% to the crude extract. Ro and UF are practiced pref. at pH 4-6 (4.5-5.5).

Pref. beta-amylase is extracted from soy bean, sweet potato, malt, barley, wheat, etc. Concentration-refining methods using membrane e.g. reverse osmosis R(O) and ultra-filtration (UF), is excellent, because it is applied using moderate conditions and can save energy. For Ro and UF it is advantageous to apply the temp. and pressure as high as possible so far as the membrane permits, but it has been impossible to apply the temperature above 50 deg.C., because beta-amylase is likely to be inactivated at above 50 deg.C. By adding the salt, RO and UF can be practiced at 50-55 deg.C. without inactivation. (3pp)

KURS ★ D16 76882 D/42 ★ J5 6113-290
Highly active fixed enzyme prepn. - by saponifying vinyl acetate copolymer, spinning obtd. modified PVA and immersing fibrous prod. in aq. enzyme soln.

KURARAY KK 07.02.80-JP-014459

A96 B04 (07.09.81) C12n-11/08

07.02.80 as 014459 (5RP)

The method is effected by (1) saponifying vinylacetate unit in the copolymer which is prepd. from vinylacetate and polymerisable monomer (I), partly or wholly and (2) spinning thus obtd. modified PVA having the copolymerizing unit (II) and (3) immersing thus obtd. fibrous modified PVA in aq. enzyme soln. for bonding the enzyme to the fibrous PVA. R₁ is H or lower alkyl. B is gp. - NR₂R₃ (III) or (IV). R₂, R₃, R₄ are each(subst.) lower alkyl. X is anionic gp. which can form salt with ammonium-form N. A is gp. which can bond the gp.B to the N atom in the amido gp.

The modified PVA can be easily made into fibres inexpensively and thus obtd. fibrous PVA shows excellent adsorbing property for enzymes. The fixed enzyme shows high enzymic activity and having fibrous form, it can be handled conveniently. (5pp)

The arrangement is intended for the anaerobic fermentation of liquid stable manure (A) or the like. It uses a tank containing a, preferably concentric, inner container (2) which extends upwards from the tank bottom (11) and has its upwardly open end (12) a short distance (S) below the level (3) of the tank contents. The material is introduced (4,5) near the bottom into the container (2) and its fermentation causes overflow (B) into the surrounding annular space (6).

Final fermentation separates a sediment (D) from waste water (W) which is discharged (14) approximately at the level of the container rim (12). The sediment (D) is separately removed (13) and the developed gas (G) collects in the top cowl (9) of the tank which is connected to a gas outlet (10).

Used in anaerobic fermentation of fermentable organic matter in water-rich waste. (11pp)

A biologically pure culture of the microorganism thermoanaerobacter ethanolicus (ATCC 31550) produces ethanol upon fermentation in an aq. nutrient medium contg. a mono- or disaccharide, pyruvate, pectin, and starch substrate.

Prof. the fermentation is under anaerobic, extreme thermophilic conditions, at pH 5.7-8.6 and 36-80 deg.C, and the ethanol obtd. is recovered. The mono- or disaccharide substrates uses are esp. glucose, fructose, D-ribose, xylose, D-mannose, D-galactose, sucrose, cellobiose, lactose or maltose.

Yields of ethanol as high as 1.8 mol per mol of fermented glucose may be achieved at 60 deg.C and pH 7.8 under anaerobic conditions, and the prod. recovered by conventional distillation techniques. (3pp)

Reactor for enzyme reactions - comprising a cell in two halves
forming a reaction chamber, with a sheet of immobilised enzyme
sealed between them

ITALFARMACO 08.05.79-IT-022448

B04 (29.09.81) *BE-883-161 C12m-01/40

26.09.79 as 079036 (1358AS)

A laminar flow reactor for reactions with enzyme or cofactor immobilised on a flat-surfaced matrix comprises two blocks with flat surfaces, one with a spiral channel forming the reaction chamber which is closed by the second block sealing against the first. The matrix is adhered to the second block and compressed against the channel.

The channel has inlet and outlet orifices at opposite ends and the matrix is a film, sheet or membrane or is paper, and is replaceable. The channel may alternatively be formed in both blocks. The arrangement permits increased contact with smaller volumes of reaction solution. (6pp)

CPC INTERNATIONAL INC 03.06.80-US-156153

(01.10.81) C13k

02.06.81 as 889045 (597KB)

The prod., having high dextrose and alpha anhydrous dextrose contents, is produced from a conc. starch hydrolysate contg. 95-99% dry solids, by stirring the hydrolysate whilst seeding with a crystalline sugar or ground crystalline dextrose. Another embodiment comprises using a 92-99% core hydrolysate at 90-135 deg.C, which is stirred at 80-110 deg.C. for 1 min to 1 hr. whilst seeding with the above or a free-filming dextrose. The crystalline dextrose is ground, pref. screened, then conditioned at 65-110 deg.C. in a fluidised bed for 7-45 min., followed by cooling to below 35 deg.C., to give a prod. contg. less than 0.5% moisture. A further embodiment is as the 2nd above omitting the seeding operation.

The process enables a single stage crystallisation giving a stable prod. which does not agglomerate after prolonged storage. (23pp)

Showering compsn. which can be mounted directly in the shower or in a suitable by-pass comprises: 'Carbowax 4000' 70.00; 'solubidilat S12' 4.00; 'G4' 0.10 (RTM), cetyl alcohol 20.00; perfume 3.00. (2pp)

ZEIS/ * D21 75856 D/42 ★DE 3008-431
Metal pins inserted into plastics baseplate esp. for dental patterns - by hot plate pressing pins into holes in plate

ZEISER M 05.03.80-DE-008431

A32 P32 (A96) (08.10.81) A61c-13 B29c-27/12

05.03.80 as 008431 (236HM)

An apparatus for pushing metal pins into receiving bores in a plastics base plate is intended esp. for producing dental patterns. The base plate is placed on a seating beneath a heated plate; the seating is then raised by a lifting mechanism towards the heated plate, so that the latter pushes the pins into the base plate, at the same time heating them by contact at their upper ends.

The seating plate, pref. has a heat-reflecting surface on the upper face. The metal pin used has an arrow head shaped portion of slightly greater length than the depth of the hole in the base plate. The arrow head portion is 0.5-2 mm (1 mm) longer than the

thickness of the base plate. More specifically, the arrow head portion is 11 mm in length.

The process is based upon the concept of not heating the metal pins until they are already seated in the plastics base plate. The pin then penetrates into the baseplate as soon as the heat reaches its tip. (12pp)

Modelling tool for denture wax patterns - with fingertip release collet and heating element

ERSA SACHS E KG GMB 24.12.79-DE-952102

S05 P32 P53 P62 P78 (08.10.81) *EP--31-294 A61c-13/20

24.12.79 as 952102 (39TM)

An electrically heated modelling appliance, specially for use in dental laboratories for work on wax patterns for partial or total dentures, has inside the outer plastic sleeve, which serves as the handle, a carrier tube for a thin tubular section enclosing a heating coil. The front of the sleeve carries an attached retainer which cooperates with the conical outside surface of a collet.

The collet is used to clamp around the shank of the various interchangeable modelling tools and is drawn inside the retainer by a coil spring. A shoulder on the carrier tube can be used to compress the spring and to release a shank from the collet.

This ensures a simple and quick exchange of the tools, even when hot. PS (5pp)

Polymer for hair fixing formulations - obtd. by reacting acrylic acid, ethyl acrylate and tert.-butyl-acrylamide in ethanol
CIBA GEIGY AG 27.03.80-US-134383
A14 (A96) (07.10.81) A61k-07/11 C08f-220/54
23.03.81 as 810112 (558MR) (E) No-Citns. E(CH DE FR GB IT LI NL)

An acrylic polymer is prepd. by introducing an ethanol soln. of a monomer mixt. of 6-8wt.% acrylic acid, 37-45wt.% ethyl acrylate and 46-58wt.% tert.-butyl-acrylamide into refluxing ethanol; and, without further heating, continuously and simultaneously adding further monomer mixt. soln. and an ethanol soln. of a free radical generating polymerisation initiator over 1-3 hrs. at a rate that maintains reflux of the mixt. by the heat of the polymerisation reaction, addn. of the monomer mixt. soln. being completed 15-30 mins. before addn. of the initiator soln. is completed.

A hair fixing formulation is obtd. by neutralising the carboxylic gps. of the polymer, in ethanol soln., by titration with aq. KOH and diluting the prod. with ethanol to polymer content 0.2-10wt.%. It can be administered using an air pump or aerosol spray.

The polymer has a good balance of water-solubility and curl retention properties. It is free from unreacted monomers, shows soln. clarity in water and alcohol and can be prepd. with good reproducibility.

The initially used ethanol may contain 30-40wt.% water. 5-15% The total wt. of monomer mixt. soln. can be introduced into the refluxing ethanol in the first step. The initiator is suitably an organic peroxide. The polymer may have an average mol. wt. of 15,000-60,000. (14pp)

OREA * D21 76228 D/42 ★FR 2477-414
Cleaning skin by applying gas foamed aq. suspension - e.g. from aerosol container, produces sensation of tightening as it dries on the skin

L'OREAL SA 04.03.80-FR-004772
(11.09.81) A61k-07/50

04.03.80 as 004772 (448NS)

The prepn. used comprises an aq. suspension of a gelling agent, a surfactant, a film forming agent and an absorbent material. A foam-generating gas is injected into the suspension to produce a prepn. which is to be applied as a lather. The prepn. is spread evenly over the area to be cleaned, allowed to dry and then removed by washing or wiping. The foam generating gas is pref. a fluorocarbon, carbon dioxide, nitrous oxide or a mixt. of these. The gas can be CO2 produced in situ by mixing an organic acid with an alkaline carbonate or bicarbonate. The pH value of the foam is pref. between 4 and 8. (12pp)

LION- * D21 76314 D/42 ★GB 2073-019
Oral compsn. contg. tranexamic acid - including carvone to reduce bitter taste and rough mouth:feel

LION CORP 08.04.80-JP-045823 (08.04.80-JP-045822)
A96 B05 (14.10.81) A61k-07/22

03.04.81 as 010546 (914HM)

In an oral compsn. contg. tranexamic acid, the improvement comprises the presence of 0.1-5 (pref. 0.3-3) wt.% of carvone. Pref. the compsn. also includes (a) l-menthol, where the wt. ratio carvone:l-menthol is 1-9:9-1, pref. 3-7:7-3, (b) a mixed humectant consisting of sorbitol and glycerine in wt. ratio 1-6:9-4, and (c) a binder of which at least 60 wt.% is an alkali metal salt of carboxymethylcellulose.

Tranexamic acid is an antiinflammatory and haemostyptic agent, and when incorporated into oral compsns. (e.g. dentifrices, mouthwashes, chewing gum, etc) it is effective for the prophylaxis of periodontosis (see JP Pat. 49-39818). By blending carvone into the compsn., the bitterness and unpleasant, rough feel of the compsn. caused by the tranexamic acid are reduced. The presence of l-menthol further improves the mouth-feel and also minimises ageing discolouration of the compsn. (13pp)

(29.09.81) A61k-09/48 A61k-31/35
30.09.80 as 192465 (478HM)

Encapsulated dentifrice consists of an edible capsule (formed of H₂O-soluble, but oil-insol. gelatin (I)) contg. contains (by wt.) 10-85% edible oil base (II), 3.35% abrasive agent (III) (to remove plaque), a surfactant (IV), and at least 10 mg of vitamin E. In use, the capsule is crushed between the user's teeth.

Wt. ratio (II):(III) is 1-8:8-1, pref. greater than 1:1. Prefd. dentifrices contain 60-85% by wt. (II) and 5-35% by wt. (III). (II) is pref. a liq. vegetable oil, esp. safflower oil. (III) pref. has radioactive dentine abrasion value 100-500, and is suitably CaCO₃, di-Ca phosphate, CaSO₄ CaSO₄ etc. (IV) may be nonionic cationic or anionic, pref. Na lauryl sulphate, and amt. is 3-15% by wt. of compsn. Opt. oil-based compsn. may also contain a fluoride (esp. SnF₂), sweetener, flavour, etc. (6pp)

FAUN/ ★ D21 77740 D/42 ★ US 4292-306
Gel-like, water free dentifrice - contains, stannous fluoride, sodium dihydrogen phosphate and carrier

FAUNCE F R 08.11.79-US-092277 (28.12.78-US-973910)
B06 (29.09.81) A61k-07/18
08.11.79 as 092277 (985BZ)

A dentifrice comprises (a) 0.03-0.05 wt.% stannous fluoride; (b) sodium dihydrogen phosphate to give pH 3.5 and to develop an energised tooth surface for enhancement of topical treatment; and (c) a water-free gel carrier which inhibits deterioration of SnF₂ and NaH₂PO₄ prior to use in an aq. environment. The SnF₂ and NaH₂PO₄ form a complex stannous fluoride fluorophosphate cpd. (I) at the energised tooth surface which develops a caries inhibiting fluorophosphate complex (II) within the crystalline lattice of the tooth enamel.

The dentifrice is a non-foaming, non-burning and ingestible topical fluoride treatment. As there is no need to rinse, the fluoride remains on the surface of the teeth - this provides a more effective barrier than conventional dentifrices which are adapted to be rinsed in the mouth. As the dentifrice is water-free, there is no tendency for the SnF₂ to decompose to inert stannic fluoride. (7pp)

FRAUNHOFER-GES FORD ANGE 03.04.80-DE-013255
(08.10.81) B01d-53/04 B01j-19/04

03.04.80 as 013255 (1280KB)

In the adsorption and catalytic decomposition of ill-smelling intestinal gases (esp. mercaptans), the intestinal gas is passed through a highly specific adsorbent which form a mixt. of water vapour, methanol, carbon monoxide, carbon dioxide and various S-contg. gases (esp. mercaptan-contg. gases) catalytically decomposes and adsorbs only the sulphur- or mercaptan-cpds., these opt. being desorbed in the form of odourless fragments.

New highly specific adsorbent for use in the procedure contains an inert, highly porous solid with a specific surface (BET) of 900-1800 sq. m/g of pyrogenic silica with a specific surface of 50-500 sq. m/g (specific surfaces being measured by argon adsorption at -196 deg. C) the surface of which is occupied by 0.1-5 wt.% Al, Zn, Cr or Fe with a specific surface of 1000 sq. m/g.

Used in suppression of mercaptan odour in patients fitted with an anal prosthesis (e.g. after surgical treatment of intestinal cancer). (24pp)

25.04.78 as 818630 (1438MR)

A prosthesis or surgical implant, for forming a cement-free joint with a bone, is produced by heating a metal substrate, with a roughened and oxidised surface, to a max. temp. (T1). This temp. is chosen so that the expansion coefft. of the glass or glass ceramic coating to be applied to the substrate is essentially the same as that of the metal. The metal surface is dipped into the molten glass, to form a surface layer between 0.2 and 2 mm thick. The coating of glass is then rapidly cooled.

A coating of the biologically active glass or glass ceramic is applied to the substrate simply and efficiently, without causing thermomechanical stresses. PS (7pp)

08.02.80 as 119947 (1358WB)

Packing for supporting intestines following hysterectomy or exenteration comprises a central rigid drain tube surrounded by an inflatable bag and with its inner vented end covered by an orificed plate and its outer connected to a suction source. An upper cup-shaped support element has a flat central part with an opening surrounding the tube vented end.

The element has an arcuate peripheral part and is secured to the bag in its central part. The edge of the element seals the upper end of the surgical cavity and supports the bowel from entry so that after surgery the cavity can be irradiated without exposure of the bowel. The element is non-inflatable and prevents pinching of bowel or omentum between packing and cavity wall. (4pp)

GEOR/ ★ D22 77568 D/42 ★ US 4291-697
Sterilisable medical cleaning element - has rupturable pouch holding antiseptic cleaning liquid within handled sponge
GOERGEVICH S 18.04.80-US-141416
A96 P34 (29.09.81) A61m-35
18.04.80 as 141416 (1358WB)

A pouch within a sponge and holding cleaning or antiseptic liquid, is of rupturable plastic film, plastic laminate or aluminium-plastic laminate, has a seal along one side and has one or more weakening lines for rupturing under pressure.

A handle extends across the rear surface of the sponge and is sealed within it adjacent to the pouch so that pressure on sponge and handle ruptures the pouch. Continued pressure on the sponge provides a continuous supply of the liquid. The pouch pref. has a polyester film outer and polyethylene film inner layer and the liquid may contain an iodine compound while the sponge is sterilised by ethylene oxide or radiation. (6pp)

Pad for protecting the body is mfd. by stretching a hydrokinetic fabric sleeve over a male mould, filling a female mould with a water-foamable hydrophilic polyurethane prepolymer and water, and bringing the moulds together.

The water may contain a surfactant and a tert. amine catalyst. The fabric is sufficiently taut to ease wetting and penetration of the foam. % Pad can be used for medical and athletic purposes. (5pp)

TAIY- ★ D22 77728 D/42 ★ US 4292-285
Removal of basic or offensive odour cpds. from gases - with activated carbon and phosphate-impregnated porous carbon
TAIYO KAKEN CO LTD 10.12.79-US-101435 (22.11.77-US-854063)
(29.09.81) B01d-53/34
10.12.79 as 101435 (478HM)

The known method of removing basic cpds. (I) (and others with offensive odours) from large vols. of flowing exhaust gases (low levels of (I)) by treatment with activated C particles is improved as follows: (a) the exhaust gas of controlled humidity is treated in countercurrent flow in a fluidised bed at below 100 deg. C with a mixt. of (i) activated C particles (II), and (ii) porous C particles (III) which have been impregnated with 1-50% by wt. H₃PO₄ and/or NH₄ phosphate; (b) mixt. of (II) and (III) contg. (I) is heated with steam to remove (I) as condensed gaseous matter and to leave the (II)-(III) mixt. which is recycled.

(II) have compression strength 500-1500 g/sq. cm, and are prepd. as follows: (1) a pitch (softening pt. 50-350 deg. C; C-content 80-97%; H:C ratio 0.3-2.5; PhNO₂-insol. fraction of less than 60% by wt.) is mixed with one or more aromatic hydrocarbons and formed into particulate spheres; (2) spheres are immersed in a solvent (pitch insol.; i.e. to extract only the aromatic hydrocarbon); (3) extrd. particles are oxidised at room temp. to 400 deg. C to afford infusible particles; and (4) the particles are then carbonised in an inert atmos. at above 600 deg. C then activated with steam.

Method is inexpensive, effective with low concns. of a variety of (I) (NH₃, pyridine, H₂S, PhOH etc.) and allows the adsorbent to be simply regenerated. (7pp)

Sterility testing of liq. flowing by gravity - to Y-connector supplying two filter units with vents
BAXTER TRAVENOL LABS INC 19.02.80-US-122548
(13.03.78-US-885747)
(29.09.81) C12m-01/12 C12q-01/22

19.02.80 as 122548 (295HM)

The sterility of a liq. sample is determined by allowing it to flow by gravity into a chamber which has a filter. A vacuum pump draws the liq. from the chamber through the filter which is then supplied with a test medium via a port of the chamber. Finally the filter is incubated and examined for signs of bacterial or mould growth. Both during the period when the sample is entering the chamber and also during vacuum filtration, the chamber is vented to atmosphere via a bacteriological and hydrophobic filter.

Preferably the liq. sample is divided into two streams by a Y connector and each stream is fed to an independent chamber. One of these is examined for bacterial growth, and the other for mould growth. The method is used for routine testing of the sterility of bottles of medicament taken at random from a production line. The amt. of liq. supplied to each branch of the Y is identical and is not affected by the head of vacuum across either filter. (7pp)

Very fine crystalline sodium aluminosilicate zeolite prodn. - with low grit fraction, by continuous pptn. and discontinuous crystallisation

HENKEL KG AUF AKTIEN (DEGS) 27.03.80-DE-011834

E33 (07.10.81) *DE3011-834 C01b-33/28

19.03.81 as 102056 (16TM) (G) No-Citns. E(AT BE CH DE FR GB IT LI LU NL SE)

Prodn. of aq. alkaline suspension of very finely divided crystalline zeolitic Na aluminosilicate (I), low in grit, of the compsn. 0.8-1.3 Na₂O : 1 Al₂O₃ : 1.8-2 SiO₂, with a water content depending on the degree of drying, min. 99.95 wt.% particles under 50 microns in size and with a high cation exchange capacity is described. Process involves (a) continuous mixing of aq. Na aluminate soln. (II) with aq. Na silicate soln. (III) in the presence of excess NaOH soln. at elevated temp. and then (b) discontinuous crystallisation of the aq. alkaline suspension of X-ray amorphous Na aluminosilicate (IV) formed, which overall has the compsn. 3.6-5 Na₂O : 1 Al₂O₃ : 1.8-2 SiO₂ ; 70-105 H₂O, also at elevated temp.

Improvement is that both reagents in stage (a) are mixed at max. 50 (40-50) deg.C. Finely distributed steam is forced into (IV) for min. 15 (20-30) min., with stirring, so that it is heated to 85-95 (90-93) deg.C, it is kept at this crystallisation temp. for 20-60 (30-40) min. and at the same time, it is stirred with a multistage, high-shear stirrer with a peripheral speed of 5-10 (6-8) m/s.

A zeolite NaA with a grit fraction of under 0.05 wt.% is obtd. It is useful as builder in detergents. (19pp)

HENK ★ D25 76064 D/42 ★EP --37-026
Storage-stable, soluble evenly coated bleach activator granulate - prepd. by mixing with powdery granulating auxiliary, wetting and granulating

HENKEL KG AUF AKTIEN 28.03.80-DE-011998

A97 E19 (07.10.81) C11d-03/39 C11d-17 D061-03/02

20.03.81 as 102083 (200BZ) (G) DE2048331 DS1162967 E(AT BE CH DE FR GB IT LI LU NL SE)

Storage-stable granulate contg. by wt. w.r.t. anhydrous components, 90-98% bleach-activator, consisting of an N-acylated amine, amide, diketo-piperazine or glycoluril, and 10-2% granulating auxiliary, is prepd. in several steps. In a 1st mixing step, the powdered bleach activator, having average grain size 0.01-0.8 mm, is mixed with 60-100 (pref. 80-95)% of total granulating auxiliary, consisting of a water-soluble cellulose

having average grain size 0.01-0.8 mm. In a 2nd mixing step, the mixt. is wetted with water or an aq. soln. contg. granulating auxiliary balance in a 0.1-10 (0.5-5) wt.% soln., and granulated. Water is then extd. from the wet granulate, pref. contg. 10-35 (15-25)% water, to reduce water content to less than 2 (less than 1) wt.%.

The granulates can be used in detergent-, bleaching-, oxidising-, and disinfectant compsns. and retain their properties. The activator particles are completely coated dissolve easily, do not agglomerate and have a favourable grain distribution. (21pp)

Arrangement of Abstracts

'MAJOR' COUNTRIES – An alerting abstract of every basic document is provided, and of examined equivalents from West Germany, Great Britain, Japan, the Netherlands and the United States, and granted and unexamined European and unexamined PCT equivalents. The abstracts are arranged in CPI class order and within any one of the 135 classes are in country and patent number order.

'MINOR' COUNTRIES – Basic headings are included in sequence with the entries from the 'Major' countries.

CPI Section Headings

See inside cover for further details.

D1: FOOD; FERMENTATION

D11: BAKING

POST/ ★ D11 77906 D/43 ★ DE 3013-476
Cream applicator for wafers - with suction chest under belt conveyor for constant speed and alignment

POSTADE KH 08.04.80-DE-013476

(15.10.81) A23g-03/20

08.04.80 as 013476 (39KB)

Cream and other top coatings are applied to wafers by a machine, including an endless belt conveyor with a magazine for the wafers at one end and a cream applicator with hopper and roll in the middle. The wafers reach the applicator roll in a steady alignment and at a steady travelling speed, at least for a predetermined distance of twice their length.

This reduces the amt. of defective prods. by uneven application of the creamy layer and saves cream because the cream thickness need not make any allowances of unevenness. If suction is used for the alignment, the cream surplus is removed from the belt. (46pp)

POST- ★ D11 77914 D/43 ★ DE 3013-590
Dough kneading machine - with separable trough locked to revolving drive head

POSTMEIER K MASCH G 09.04.80-DE-013590

(15.10.81) A21c-01/02 B01f-09/10

09.04.80 as 013590 (39DH)

Kneading machine for bakeries has a base for a revolving trough which can be sepd. from the machine and moved about by an independent wheeled tubular trolley. The drive head of the base has a vertical axis of rotation and is equipped with a power operated lifting element. It also carries locking elements for the trough base which are disengaged by the lifting action.

The design facilitates the portability of the trough and results in the smallest possible weight for the machine, the trough and the lifting facilities. (19pp Dwg.No.2)

HABE/ D11 75986 D/42 = EP --37-454
Bread and pastry mfr. - from grain flour mixed with green flour contg. ground pasture grass, clover and/or lucern

HABERL P 05.04.80-DE-013348

(14.10.81) *DE3013-348 A21d-02/36 + A23l-01/16

05.02.81 as 100800 (200BZ) (G) No-Citns. E(AT BE CH DE FR GB LT NL SE)

Green flour of ground pasture- and meadow grasses, clover- and/or lucerne types (medicago) is added to an initial mixt. for preparing baker's wares, esp. bread, biscuits, cookies, long-life bread, etc. The initial mixt., contg. a grain fraction, -grist or -flour, esp. rye- and/or wheat flour, water, yeast, NaCl and opt. further additives, is baked after raising the kneaded dough.

The green flour plants, esp. lucerne, have a high content of proteins, hemi-celluloses, pentosans and minerals. A high water absorption and dough yield can be achieved and the dough ripens quickly. The increased content of Ca, Mg, Na, K, Fe and Co and of lysine and cystine increases the nutritional value of the bread and also improves bread taste and aroma. (18pp)

RHON ★ D11 78111 D/48 ★ EP --37-758
Powdered compsn. contg. sucro-glyceride, caseinate and malto:dextrin - useful in prodn. of cereal based cooked goods, e.g. cakes and biscuits

RHONE-POULENC INDUSTRIES 24.03.80-FR-006463

(14.10.81) A21d-02/16

13.03.81 as 400384 (1251KB) (F) FR1483176 FR1372646 US3060030 FR2067391 E(AT BE CH DE GB IT LI LU NL SE)

Powdered compsn. consists of sucroglycerides (I; i.e. the mixt. of prods. obtd. by reacting sucrose with triglycerides), pref. at 40-80%; a caseinate (II), pref. at 10-50%, and a maltodextrin (III), pref. at 20-60%. Pref. (I) are derived from palm oil, tallow, lard or copra oil, and (II) is esp. sodium caseinate. The compsns. are made (a) by drying an aq. emulsion of the three components or (b) by mixing as powders (I) supported on (II) with (III), or (I) supported on (III) with (II).

The compsns. are useful as additives in cooking of cereal-based prods., e.g. cake or biscuit mfr., esp. being used at 0.3-2 wt.% on the flour. The emulsifying effects of (I) are enhanced by (II) and (III), giving doughs of improved homogeneity and easier workability; reduced energy demands for kneading; slowing down of the staling process, and increased expansion of prods. (30pp)

JOUR/ ★ D11 78130 D/48 ★ FR 2477-838
Method of packaging stacked pancakes interleaved with sepg. papers - each covering only slightly more than half pancake area

JOURNO C 17.03.80-FR-005890

(18.09.81) A21d-08/02 A21d-13/08

17.03.80 as 005890 (448HM)

In method of packaging stacked pancakes and similar circular sheet prods of edible paste. Sheets of sepg paper are interleaved between the pancakes ie. the stack consists of alternate pancakes and paper sheets.

Each sepg sheet is now a segment of a circle of the same dia as the pancake and covers an area slightly greater than half the circle. Alternate sepg sheets extend in diametrically opposite directions from a median plane of overlap in plant view.

A saving of 47 per cent of sepg paper is claimed. (5pp)

SCHM/ D11 35000 A/20 = GB 1600-551
Waffle filled with honey and corresp. honey depositor - sandwiches honey portions in leakproof cavities between sheets of battery

SCHMIDT M 18.01.77-DE-701765

(21.10.81) *BE-862-706 A21d-13/08 A23l-01/34

13.01.78 as 001365 (006TM)

Wafer biscuit contg honey comprises top and bottom wafers joined by edible adhesive, one or both wafers having a honey chamber pref in the form of a cup-like recess.

Specifically the wafers are impervious to honey, or lined with impervious material, or the honey is pre-packed in a sachet. Pref honey extrusion appts includes press fluid mechanisms for delivering honey in rod-like form and for cutting off individual portions from the rod. (6pp)

DIEP- D11 51657 A/29 = GB 1600-783
Double-screw extruder outlet for paste strips - has diffuser grid and pressure equalising chamber

DIEPAL 23.01.78-FR-002457 (16.03.77-FR-008596)

P71 + P42 P51 (21.10.81) *BE-864-755 A21c-03/04 B29f-03/04

08.03.78 as 009256 (006TM)

Extrusion appts specifically for foodstuff dough comprises an extruder nozzle spaced from a diffuser plate by a press equalisation chamber, the plate being between the chamber and the tip of an extruder screw.

The plate has a flat side facing the chamber, and a conical side facing the screw tip and of the same taper angle as is the tip. Ducts in the plate are arrayed as two opposed circular arcs of equal radii, symmetrical about the plate centre

The plate and chamber prevent rotation of an extruding dough strip about its lengthwise axis. (9pp)

BOMB- ★ D11 78229 D/48 ★ GB 2073-578
Spiral depositor for depositing batter in hot oil - to form Jalebi, with nozzle simultaneously rotating and pivoting

BOMBAY HALWA LTD 10.04.80-GB-011878

(21.10.81) A23g-03/02

10.04.80 as 011878 (295AT)

A spiral depositor comprises a container holding material to be deposited. A nozzle communicates with the container and is pivotally mounted about a horizontal axis. During deposition of the material the nozzle is rotated about a vertical axis and simultaneously pivoted about its horizontal axis.

Pref. the nozzle includes a transverse extension engageable in a member movable towards and away from the base of the container to cause the pivoting movement.

The material may be a flour-based batter which is deposited in a bath of heated cooking oil to form a jalebi. (4pp)

AMMA ★ D11 78248 D/43 ★GB 2073-647
Rounder bar for shaping dough pieces - cooperating with conveyor belt via foot responsive to belt surface irregularities

AMF INC 11.04.80-US-139327

(21.10.81) A21c-11

12.03.81 as 007853 (295AT)

A rounder bar cooperates with an endless conveyor of a dough-shaping appts. The rounder bar and conveyor together form a pocket for the dough while the lower tip of the bar is responsive to irregularities in the conveyor surface for maintaining continuous wiping contact along the full length of the bar.

The rounder bar is attached to a fixed support by a connector which is adjustable to move the rounder bar towards and away from the conveyor to a desired operating posn. in which it can be locked.

The appts. is used with a conventional dough dividing appts. for converting known vols of dough into well rounded spherical pieces of equal size for subsequent processing. The surface contact between the belt and bar is just sufficient to prevent frictional damage to the belt, yet does not permit the escape of dough. (5pp)

MOFO= ★ D11 79329 D/43 ★SU -800-873
Apparatus to determine gassing of bread dough - using container with open/ended vessel connected to tube associated with movable pointer and graduated glass tube

MOSC FOOD IND MECHN 16.04.79-SU-755980

S03 (30.01.81) G01n-33/10

16.04.79 as 755980 (29MC)

Apparatus for determining the gassing possibilities of dough, for control purposes during bread-making under laboratory conditions, has container for the dough (1), which is open at the bottom, provided with a float, pipeline (6), graduated glass measuring device (10), closed reservoir (11) filled with oil (12), and pump (16).

The accuracy of the measurement is increased, with the individual determination of the gassing the gas-holding capabilities of the dough, by providing the apparatus with a

flexible tube (6) and an indicator of linear motion fastened to a rod (4), with a stationary graduated disc (18) and movable block with pointer (17). The flexible tube is passed through the block and connected at one end to the open-ended container (7) and to the glass measuring tube (9) at the other end. (2pp Dwg.No.1)

EZAK/ ★ D11 79444 D/43 ★US 4292-917
Automatic cake topping dispenser - with vertically movable and rotatable cake support plate below nozzles

EZAKIN 01.11.79-JP-142538

P42 (06.10.81) B05c-05/02

08.04.80 as 138563 (1358KB)

A dispenser includes a pair of nozzles delivering e.g. whipped cream and adjustable for height and spacing above a cake support plate which can be raised and lowered and also rotated so that a ring of topping can be applied. Cakes are delivered to the dispenser by an endless conveyor.

A shaft for operating the plate can coast alternatively with the conveyor to control distance between nozzle and cakes. The belt may have a series of pivotally linked support plates, with guides on the vertically movable shaft positioning successive plates at a given height in the centre of the belt. A photoelectric sensing system may be used to monitor nozzle-cake spacing. (7pp)

CAIE/ ★ D11 79488 D/43 ★US 4293-296
Cheese block mould - with parallel rods carried by lid to form through holes

CAIELLO J A 13.10.78-US-951213 (31.10.77-US-847361)

(06.10.81) B29f-01/06

13.10.78 as 951213 (1358KB)

A mould includes an open-ended vertical sleeve closed at the bottom by a support table, and at the top by a lid carrying spaced parallel rods extending through the sleeve to form the holes. The mass is extruded through an opening in the table into the sleeve.

The lid is pref. releasably attached to the sleeve and the rods have longitudinal bores for coolant. A shelf is pref. connected to the sleeve bottom for releasably retaining the cheese mass and for a sleeve with corners there may be a shelf at each corner. Slices can be cut from the solidified cheese to form topping slices with holes for vapour and juice when used in a pizza. (22pp)

INTT ★ D11 79616 D/43 ★US 4293-572
Moisture barrier compsn. for baked or fried foods - to prevent moisture loss and staleness during storage

INT TELEPH & TELEG CORP 14.09.79-US-075615 (28.02.78-US-881935)

(06.10.81) A21d-13

14.09.79 as 075615 (955NS)

In a method for applying a moisture barrier to baked or fried food prods., a water in oil emulsion is prepd. contg. 6-40 wt.% of a saccharide, polysaccharide or dextrin dissolved in 12-43 wt.% water, dispersed in 25-75 wt.% of acetylated monoglyceride, or triglyceride combined with an emulsifier, and held at a temp. at which it is a stable liquid emulsion. The cooked food prod. is cooled to a temp. below the emulsion holding temp. and then coated with the emulsion. The coating is allowed to set, after which the prod. is iced.

The barrier retards water loss and staling of the food material, and the concomitant deterioration in the icings. The method is esp. useful for yeast raised iced doughnuts. (8pp)

D12: MEAT; FISH PROCESSING

GOOS/ ★ D12 77836 D/43 ★BE -889-206
Automatic animal stunning machine in slaughter house - has pendulum type mounting with electrodes and limit switch at end of restrainer

GOOSSENS J B R 12.06.81-BE-889206

X25 (01.10.81) A22b H05c

12.06.81 as 889206 (1011HM)

Automatic machine for stunning animals to be slaughtered by electrocution. The machine is placed on top of a restrainer, which guides the animals to make contact with two electrodes. The animals are conveyed to the end of the restrainer where a

restrainer by gravity.

The machine is made with a pendulum a few metres long with two electrodes. It ensures that the animal is supplied with the appropriate voltage for the appropriate time in the appropriate position. The voltage is switched off at the instant that the animal reaches the end of the restrainer. This is done to prevent other parts of the head and neck muscles from being subjected to a voltage. This could cause the muscles to tear or the bones to break. The electrodes are designed so as to form a sort of funnel aligning the head of the animal such that it travels along the centre of the restrainer. There is free space established between

ne animal has been dealt with.

The machine provides a saving in manpower. The quality of the meat is improved as a result of the use of a higher voltage in the stunning process. It produces an increase in production, achieving figures of more than 600 animals per hour. The machine is easy to operate because of the absence of a drive system. (5pp)

LUCK- ★ D12 77882 D/43 ★DE 3008-742
Food processing work table - with ice top produced by tubular refrigerator coils

LUCKE & DRUCKER GMB 07.03.80-DE-008742
(15.10.81) A22c-17 A23p-01

07.03.80 as 008742 (39AS)

A work table for the processing of food, specially for cutting and chopping of meat, consists of a table top which carries tubular refrigerator coils. A frame can be inserted around its periphery (made of stiff PVC foil) so that the space can be filled with water to be turned into an ice table top. Before the table is used for cutting or chopping, the frame is removed from it.

Arrangement prevents the unhygienic conditions of wooden tops which harbour microgerms in the cuts and need cleaning with boiling water or steam at least once a day. It also prevents sharp splinters from entering the food, if table tops are made of hard plastic materials are used. (11pp)

UNIC D12 72787 S/46 =DS 2114-903
Stuffing machine for foodstuff cases

UNION CARBIDE CORP 30.03.70-US-023934
+ Q31 (15.10.81) *DE2114-903 + B65b-39/06

27.03.71 as 114903 (39HM)

The closure mechanism for a stuffing machine to fill food paste into tubular cases is attached to a filler tube which is charged by a Y-pipe and has a central rod with a power cylinder located between the joining pipes. The rod carries at the open end of the filler tube a sealing plate and is guided by two internal ribs in the tube so that when the rod is retracted, the sealing lip of the sealing plate is pressed against a seat at the filler tube end and closes it.

This closes the filler tube efficiently and prevents remnants from protruding from the end. It functions well even when the paste includes lumpy particles. PS (6pp)

DORN- D12 42497 B/23 =EP G004-933
Band saw for meat and bones - with retractable holding plate for large pieces

MASCHFAB DORNHANG GM 26.04.78-DE-818147

+ P54 P56 P62 (14.10.81) *DS2818-147 A22b-05/20 A22c-17/02

10.04.79 as 101101 (236AT) (G) DS2625096 DS-932650 FR2084272 GB1209457 US2273715 US2722254 US2786497 US2850055 US3009492 E(BE CH FR GB IT LU NL SE)

A meat slicing machine (for slicing meat and bones) comprises a flat table, a band saw operating vertically through a slit in the table, an adjustable slicing plate parallel to the band saw at one side of it, and a holding plate parallel to it and also adjustable at the opposite side.

This holding plate is mounted perpendicularly on the end of a horizontal thrusting or adjustment rod itself slidably mounted in a bearing on a pivot at the end of the table. The pivot bearing is transverse to the thrust rod, i.e. perpendicular to the band saw plane, so that when the holding plate is retracted to its mounting and the mounting is pivoted about the bearing, the holding plate revolves into a horizontal position where it forms a continuation of the table surface.

Thus when a large piece of meat is placed on the table, the holding plate swung down to permit this operation acts as an extension to the table itself. (6pp)

Mfr. of continuous cellulose hydrate tube with an internal water-proof coating contg. a chemical substance comprises applying the liq. dispersion to the inside of the tube. The tube passes vertically upwards in a region where the liq. has a virtually constant surface level inside the tube, then the tube passes between two rolls or belts in a roll gap which forms the metering gap; thus the film applied to the internal surface of the tube from the liq. is metered to the desired quantity at this point and after this the tube continues upwards through a drying stage, typically a hot-air unit.

Here the moisture content of the internal coating liq. evaporates and diffuses outwards through the tube wall, thus forming an internal film on the tube. The tube is subsequently cooled, opt. sprayed with water on its external face, pressed flat and wound onto a storage roll.

The method does not require the use of an excessively diluted dispersion which results in a non-uniform film and distortion of the tube properties due to the action of too much water. (42pp)

Sausage skin made from sheet with glued seam - containing pores to permit passage of smoke

HOECHST AG 05.04.80-DE-013320

A97 + Q32 (A11) (14.10.81) A22c-13 B65d-37 C08j-05/12

30.03.81 as 102378 (236DH) (G) No-citns. E(AT BE CH DE FR GB IT LI LU NL SE)

A tubular skin for foodstuffs, esp. sausages etc., is composed of a rectangular or endless blank of sheet bent around its longitudinal axis so that its edges overlap or are taped together; in the region of the adhesive seam the skin material contains a water-insoluble bond-promoting resin. Claimed resins include urea based material. The longitudinal edges (1,2) are bonded together by a layer (3) contg. a contact adhesive. The skin is pref. made of regenerated (fibre reinforced) cellulose. In one embodiment (as shown) the edges overlap and the layer is between them, while in another embodiment the edges abut and the layer (3) is on either the outside or the inside of both edges with a strip of film acting as sealing tape. With this latter arrangement, the bond-promoting agent is situated between the contact adhesive and the skin material.

The sausage skin is simple and inexpensive to produce, the process not requiring the high temperatures and long dwell times for adhesive to set that are common in previous processes. (56pp Dwg.No.1)

Viscose coating of tubular fibrous sausage casing - by internal and external annular dies with oversize aperture

TEE PAK INC 07.04.80-US-138068

A97 (14.10.81) A22c-13 B29f-03/10

19.03.81 as 301181 (HM) (E) No-Citns. E(AT BE CH DE FR GB IT LI LU NL SE)

A tubular fibrous web passes through a cpd. die which applies a liq. to at least one, and pref. both, faces of the web. The web becomes completely penetrated by the liq. independent of the size of the die orifice provided it is greater than a minimum size. The minimum size is that sufficient to supply the required coating liq.

Pref. the volume of liq. discharged by the die per unit length of web is 0.52-0.66 of the maximum discharge rate of the die. The coating liq. forms a laminar flow on the moving web which pref. moves at 7.6 metres per min.

The appts. applies a viscose coating to a fibrous web to form a sausage casing. The coating penetration is not dependent on the viscosity or concn. of the coating liq. (14pp)

Abattoir conversion of waste blood into paste for pet foods - by heating and homogenising in elevating screw conveyor

CLAVEL R 12.03.80-FR-005591
(18.09.81) A22b-05/04

12.03.80 as 005591 (448HM)

Abattoir process and installation are for converting waste blood into a clotted paste. The waste blood is fed into the lower end of a screw conveyor which is inclined slightly to the horizontal, pref at between 2 and 8 deg. The blood is heated as it is conveyed so that the upper end of the conveyor discharges a homogeneous paste.

The conveyor is pref equipped with two, coaxial screws in series. The first of the screws has a helix of shorter pitch than the second. The first screw rotates faster than the second. The ratio of helix pitches of the two screws is pref inversely proportional to the ratio of speeds of the two screws. The first screw is pref rotated at between 10 and 30 r.p.m and the second screw at a higher speed between 20 and 60 r.p.m. The conveyor is pref steam jacketed to operate at between 85 and 110 deg C.

Used to convert waste blood in abattoirs into a homogeneous clotted paste of approximately the same compsn as blood. The prod is intended partic as an ingredient for pet food prods. The paste is easy to handle and to pack into containers for transport at ambient temp the paste will keep in good condition for 12 days or so. The process obviates irreversible sepn of plasma and red cells and is cheaper to operate than processes in which the blood is dried to a powder. (12pp)

Opening oyster shells to extract oysters for treatment - employing brief thermal shock and vacuum cooling to overcome adductor muscle

SOC FR EQUIP COLLEC(BRET-) 11.03.80-FR-005378
(18.09.81) A22c-29/04

11.03.80 as 005378 (448HM)

Process and installation are for opening oysters which are to be prepd for eating. The oysters are first washed in bulk and then briefly heated in an oven to administer a thermal shock which relaxes the oysters adductor muscles. The oysters are then transferred into a closed vacuum chamber for rapid cooling and a violent drop in pressure which weakens the adductor muscle. The oysters discharged from the vacuum chamber are easily hinged open and, with shells still attached together they are transferred for further prepn.

The oven temp is pref between 300 and 350 deg and each oyster is carried through the oven in a time of one to one and a half minutes. Time and temp of oven treatment are matched with size of oyster. The oysters are held in the vacuum chamber for a period of several minutes.

Used for opening oyster shells so that oysters can be prepd for eating. Mechanisation reduces labour involvement and prod cost. The shell is not clamped or levered by machine so that broken shell in the prod is not a problem. The oyster flesh is kept at a low temp throughout the process to prevent bacterial growth. (5pp)

Recovery of chitin from shellfish wastes - by grinding and sepg. the lighter fraction with air stream

SYSTEMS CONSULTANTS 20.04.79-US-031846

A11 C03 J01 P41 (D13 D15) (06.10.81) B02c-19

20.04.79 as 031846 (1248AS)

Recovery of chitin (I) from shellfish waste comprises first drying the waste, then mechanically reducing its particle size to 10-400 microns and finally using a gaseous stream to classify and separate a lighter fraction of active (I). A heavier fraction contg. protein and salts remains as residue.

The procedure is economic, simple and easy to control, in contrast to the usual chemical extrn. procedures. The (I) retains the properties of the natural material and so is more useful as a chelating, flocculating and co-ordination agent. The residual matter still contains carotenoid pigments, astaxanthin and its esters, so that ground matter obtd. from it for use as meal has better quality and enhanced protein levels. The (I) prod. is a more cost effective and better starting material for the prodn. of chemically produced chitin and chitosans for biomedical applns. etc. Known uses of (I) include treatment of water, electroplating and metal finishing solns., nuclear wastes, effluents contg. trace organic cpds. or heavy metals or rare metals, or for textiles, in photofinishing etc. (4pp)

Dry, water-soluble particles of an edible material (I) have surface area above 5 m²/g, and a microporous structure in which the pore vol. of micropores of radius less than 150 angstrom is above 5 microlitre/g. Particles pref. have surface area above 2 m²/g; and have a most frequently occurring radius of less than 150 Angstrom, pref. less than 50 Angstrom, esp. less than 3 Angstrom. (I) consists of soluble solids obtd. from roasted coffee, roasted chicory, roasted wheat, roasted blend of wheat and molasses, or is a carbohydrate from sugars, dextrans or corn syrup solids, etc. Particles may be used as

rods., or pref. above 5% for CO₂ to be used for carbonation. Loaded particles are added to powdered food prods. at 0.01-2% by wt. Suitable aromatic or essential oils to be adsorbed include conventional coffee oil aromas, citrus oils, etc. Aromatic oils, etc. may be loaded onto particles by mixing the particles with a condensed CO₂ aroma frost, and allowing the CO₂ to sublime off. The edible particles are useful for adsorbing high levels of aromatic or essential oils, and in a closed container they release these in a repeated, controlled manner over a long period of time. The particles are thus useful for aromatising a variety of food prods., esp. soluble coffee or tea. In addn., particles contg. adsorbed CO₂ can be produced for carbonation purposes. (29pp)

White, bland, fibrous protein prod. - prepd. by unidirectional freezing of aq. protein and alginate gum, slicing, gelling and heat setting

GENERAL FOODS CORP 04.04.80-US-137214
(14.10.81) A23j-03
04.03.81 as 301257 (478BZ) (E) No-cltns. E(AT BE CH DE FR GB IT LI LU NL SE)

A white, bland-tasting protein prod. texturally and nutritionally similar to the meat flesh of mammals, poultry, or seafood is prepd. as follows: (a) a mixt. of a heat-coagulable protein (I), a thermally irreversible gum (II) and H₂O is cooled to form elongated ice crystals and to separate (I) into well-defined, well-ordered, independent fibres; (b) the solid mass is sliced parallel to the longitudinal axis of the ice crystal formation to form fibre bundles; (c) the (II) in each fibre bundle is gelled to reinforce the fibre-like structure; (d) resulting fibre bundles are heated to coagulate (I); (e) the coagulated fibre bundles are treated with an aq. soln. of a sequestering agent (III) to modify the texture and extract salts affording off-flavours; and (f) the prod. is sepd.

Inexpensive method affords a fibrous, continuous phase protein material which has structural integrity and is readily accepted by consumers. In addn., a wide range of meat-like textures can be simulated. (24pp)

GUIT/ ★ D13 78133 D/43 ★FR 2477-844
Laxative chocolate prod. contg. wheat bran - using bran of 200-600 micron particle size, gives improved regulation of intestinal transit

GUITARD L 13.03.80-FR-005692 (29.03.79-FR-008419)
(18.09.81) A23l-01

13.03.80 as 005692 Add to 29.3.79-7908419 (597MR)

The prod'ls made by incorporating wheat bran of 200-600 micron particle size in a paste obtained from roast ground cocoa nuts.

The pref particle size is 350-450 microns. Wheat flour is pref incorporated esp such that the bran is at least 30% of the bran flour mixture particularly in using a grinding of the total wheat. Pref 0.2-0.8g bran/gm cocoa powder is used. The bran/cocoa mixture is homogenised after addn of the usual additives such as sugar and flavouring. The prod has the same taste as normal chocolate.

Used to prepare chocolate with laxative properties, it has been found that the particle size above ensures a better regulation of intestinal transit. (5pp)

Appts for applying heat-liquefiable sugar-based coating material to biscuits etc has a distributor enclosed in a housing contg a water-saturated atmos. which prevents the material such as fondant icing from premature hardening and caking on the distributor.

Pref the enclosure is a transparent hood, to the interior of which water vapour is fed continuously to make up losses, i.e. by escape or condensation. (4pp)

BROL ★ D13 78230 D/43 ★GB 2073-574
Cheese compsn. contg. powdered alpha-cellulose - pref. dried to a water content of at most, 18 percentages

BROOKE BOND FOODS 10.04.80-US-138908
C03 (21.10.81) A23c-19/08

10.10.80 as 032817 (1476AT)

Cheese compsn. comprises a mixt. of powdered alpha-cellulose, including both amorphous and crystalline components, and a natural and/or processed cheese material.

Pref. the amt. of alpha-cellulose present is 0.5-35 wt.%. Typically the powder particles are up to 400 microns in ave. length, pref. up to 350 microns and best 40-290 microns. Pref. the compsn. is dehydrated to a water content of not more than 18 wt.%, best no more than 10 wt.% e.g. 7-10 wt.% or 3-7 wt.%. Cheeses esp. suited for use in the compsns. are very hard, hard,

semi-soft and processed cheeses.

The cheese compsn. is useful as a food source for humans and animals. The cellulose allows removal of water from the compsn. by economical conventional drying techniques while substantially retaining the fat content of the cheese, which would ordinarily melt under conventional drying conditions and be lost. The removal of water means there is less weight to transport; and the resistance of the cheese to mould and bacterial growth is enhanced. (10pp)

E24 (29.09.81) *J54142-236 C09b-61

28.04.78 as 051029 (57RH)

Process comprises ester exchange treatment a paprika pigment contg. substance in the presence of alcohol and a basic catalyst and addn. of a solvent with no or low polarity.

The ester exchange reaction treated prod. is neutralised with acid and oil layer is sepd. The non-polar solvent or low polar solvent such as hydrocarbons, halogenated carbons, ethers, carbon disulphide, etc. is added to the oil layer to deposit paprika pigment. The raw material used is the seed case of cayenne pepper, its dried prod. and oleo resin obtd. from it.

The obtd. prod. has excellent colour development and light resistance, has stable colour and has no abnormal odour. Mfg. operation is safe and easy, and yield is high. (J54142236) (3pp)

SANE D13 19056 C/11 = J8 1041-866
Colour stable, anthocyan colourant compsn. - contg. anthocyan colourant and soln. of flavone or flavanol cpd. in an amt. less than that of anthocyan

SAN EICHEM IND KK 18.07.78-JP-088078

E24 (29.09.81) *J55013-771 C09b-61 + C09b-67/22

18.07.78 as 088078 (136NS)

Compsn. contains (i) anthocyan colourant and (ii) soln. of flavone type or flavanol type material having a concn. below that of saturation in a quantity below that of component (i). The compsn. is stabilised and has excellent light resistance, brightness and colour. The colourant is used for colouring drinks and foods.

Flavone materials include, e.g. apigenin, primetin and tricin, and flavanol materials include, e.g. rutine and myricetin. Component (ii) is added to non-toxic solvents such as water, propylene, glycol and glycerine, opt. with heating. The soln. obtd. is added to anthocyan and mixed homogeneously. (J55013771) (3pp)

SAOK D13 66769 C/38 = J8 1041-667
Carmine colouring compsn. - comprising fine cellulosic substance which contains chitosan and has absorbed carthamin

SANYO KOKUSAKU PULP 30.01.79-JP-008696

B07 E02 (D21) (29.09.81) *J55102-659 C09b-61 + C09b-67/02

30.01.79 as 008696 (DH)

The colouring compsn. consists of fine cellulosic substance such as cotton, pulp, etc. which contains below 20 wt.% chitosan and has adsorbed carthamin. The cellulosic substance has average grain size of below 100 microns in the long axial direction and below 30 microns in the short axial direction.

Fine cellulosic substance contg. below 20 wt.% of chitosan is suspended in alkaline water soln. which contains carsamine. The pH value of the suspension is adjusted to 7-3 by the addn. of acid under stirring so that carsamine may develop colour and may be adsorbed by cellulosic substance.

Chitosan-contg. cellulosic substance and carsamine are kneaded or grounded in the presence of water and/or organic solvent in which carsamine is soluble. The process is followed by drying, crushing and opt. sieving. The colouring compsn. is readily dispersible in both aq. and oily substances and tints them in clear carmine colour without causing bleeding. (J55102659) (5pp)

Battery moulds in cheese mfr. - have outer frame divided into individual moulds each with cross-plate acting firstly as base and then as press after turning

PERFORA ROSSEN HAS 05.03.80-DK-000949

P13 (05.10.81) A01j-25/06

27.02.81 as 001310 (1161PW)

The pressed cheese production unit uses battery moulds which successively pass a filling station a primary turning station, a press, a discharge station, a secondary turning station, and a cleaning section.

Each battery mould comprises an outer frame which is divided into a number of individual moulds by intersecting separating walls. The individual moulds each have a cross plate which is limitedly movable, serving firstly as a base and then, after the first turning process, as a press plate for the cheese mass.

This enables the cheese to be collected in the tops of each individual mould and easily removed in the discharge station.

Confectionery prod. including cryptocrystalline sweetener - e.g. sorbitol, sprayed as heated aq. soln. cooled by compressed gas

CHIMICASA GMBH 02.04.79-US-026357

(06.10.81) A23g-03/30

02.04.79 as 026357 (295)

A cryptocrystalline, sweetener-containing product is prepared by spraying a heated, aqueous, low viscosity, high solids, sweetener solution as a fine spray into a vessel having a cooler atmosphere. The solution may be sorbitol, sucrose, fructose, manitol or glucose, at 180 to 315 deg.F and containing 70 to 99.5 per cent by weight sweetener.

Cool, compressed dry air is introduced into the heated spray nozzles. The heated solution is maintained hot until the moment of spraying. The air has a temp. of 40 to 120 deg.F and a pressure of 40 to 125 psi. The phase change from liquid to solid of the sweetener solution occurs without loss of moisture. Thus an atmosphere is formed in the vessel of a sweetener product with a particle size less than 5 microns. This is mixed with a food or confectionery product.

Used in the formation of confectionery products such as dietetic chocolate bars, chewing gum or candies. The sweetener particle size is small yet its preparation does not require expensive equipment. (9pp)

10.03.80 as 219561 (200KB)

Crude water of opt. quality, but esp. deionised or distilled water, is (a) ultra-purified by oxidising with peroxydisulphates, esp. K peroxydisulphate, at 70-80 deg. C, in the presence of acids, esp. H₂SO₄ and standard catalysts, esp. Ag ions, before (b) distn.

The water is free from organic cpd. traces and can be used as reference-water in organic analysis, semi-conductor industry and medicinal field. The oxidising agent is charged to the reaction mixt. as a satd. aq. soln., either continuously or batchwise, using mixing devices. Excess oxidising agent is completely decomposed on heating from reaction temp. to water b.pt. (5pp)

Portable settling tank - designed as shipping container with ascending flow between parallel baffles

UEBERALL P 14.03.80-DE-010365

(15.10.81) B01d-21/02 C02f-01/52

14.03.80 as 010365 (39HM)

A portable settling tank, specially for water and sewage, is designed as a rectangular box with parallel baffles which divide the ascending flow into several parallel paths. The sinks are deposited on the baffles and as the tank is mounted in an inclined position, the deposited particles can slide down to a sump where they are periodically discharged.

The boxes are designed in the dimensions of standard shipping containers which facilitates their transport by land and sea. They can be produced at low cost and have a greater utilization factor of the space. (19pp)

SCHD ★ D15 77951 D/43 ★ DE 3013-881
Waste water aeration in equaliser and storage basins - for partial biological degradation of industrial waste water dirt load at constant redox potential

SCHERING AG 10.04.80-DE-013881

(15.10.81) C02f-03/12

10.04.80 as 013881 (200AT)

In the partial biological degradation of an industrial waste water dirt load by aeration in an equalising- and storage basin, aeration takes place at a constant redox potential at -250 to -500 mv, at pH 7. Aeration is controlled over the whole measured redox potential and the redox potential is thus kept constant. Min. material required for bio-mass growth is added to the waste water in quantities such that bio-mass losses resulting from dilution are balanced out and the redox potential does not deviate from the constant value. The addn. is controlled in function of redox potential deviation from the theoretical value and of aeration intensity.

Degradation rates up to 50% are achieved in over 24 hrs., without flocculation, as opposed to 10-20% by a standard process. The O₂ transfer values are increased to 35 kg O₂/hr, as opposed to 20 kg O₂/hr with a standard aeration device. (5pp)

SACH- ★ D15 77960 D/43 ★ DE 3014-082
Water sterilisation appliance - with spiral grooves for water flow between cathode cylinder and anode wires

SACHS SYSTEMTECH GM 12.04.80-DE-014082

X25 (15.10.81) C02f-01/48

12.04.80 as 014082 (39BZ)

A water sterilisation appliance, based on the anodic oxidation principle, has a cylindrical purification chamber with an inlet on top and an outlet at the bottom. Spiral grooves along the inside wall act as restrictor channels for the water flow between the electrodes. One of them is a cylinder and forms the inner wall of the restrictor channels; the other consists of wire spirals which are embedded in the grooves.

This appliance has a uniform purification action, even at very

slow flow rates. No residual water is left in the cell after use so that no germ nuclei can arise. (13pp Dwg.No.1)

SACH- ★ D15 77967 D/43 ★ DE 3014-130
Water sterilisation appliance based on anodic oxidation - with water flowing from permeable anode to cathode

SACHS SYSTEMTECH GM 12.04.80-DE-014130

X25 (15.10.81) C02f-01/46

12.04.80 as 014130 (39RH)

A water sterilisation appliance, based on anodic oxidn., consists of a tubular purification cell through which the water passes from the inlet to the output. The anode is designed as a permeable, electrically conductive element at a distance from the cathode or cathodes; if two cathodes are used, one is arranged upstream and the other downstream of the anode.

This combines an improved sterilisation action with a compact design.

The electrode cell contains a tube (1), made of insulating material, which is closed by two cathode caps (3,5), connected by terminals (7,9) to the minus pole of a power supply. An anode element (11) in the centre consists of electrically conductive material which is permeable to water (wire mesh, porous sinter metal or carbon) and is connected to the plus pole by a terminal (13). (9pp Dwg.No.1)

VNOR/ ★ D15 77972 D/43 ★ DE 3014-169
Floating air compressor - with open air motor and submerged compressor resting on floats

VON NORDENSKJOLD R 14.04.80-DE-014169

Q56 (15.10.81) B01f-03/04 C02f-07 F04d-25/02

14.04.80 as 014169 (38AS)

Compressor for use during hydraulic constructional work or for the aeration of ponds or clarification basins rests on at least one float. The motor is arranged to remain above water level and drives the totally submerged compressor section through a vertical shaft. When two floats are used, one is designed as a silencer for the air intake and the other for the air delivery.

An open-air motor has a better efficiency than a submersible motor and requires less power. Floating design saves the

infrastructure and cools the compressor efficiently. It also improves the flexibility in the application of the compressor in different localities. (15pp)

MULLER/★ D15 77987 D/43 ★DE 3027-454
Settlement tank for sewage sludge - has two funnel shaped compartments, first for coarse, second for fine precipitation

J01 K05 M25 (15.10.81) *DE2550-751 B01j-19/04
12.11.75 as 550751 (39HM)

Method for the recovery of dissolved, suspended or chemically fixed substances from a liquid in an ascending flow, e.g. the recovery of uranium from sea water, is based on stabilising the flow resistance through an absorber bed and on making it uniform by preceding the bed by a device offering resistance to the flow, e.g. a grating or mesh. The absorber particles are arranged in a fluidised bed with a cross-sectional area which increases in the ascending direction so that the flow velocity is gradually reduced.

The absorber particles are either kept in layers at the same level or they sink slowly, as their weight rises because of adsorption, from the charging to the discharging point. Such a method reduces contact and friction to a minimum and can be carried on continuously. PS (7pp)

Waste-water treatment with oxygen under hydrostatic pressure - regulated by movable weir to minimise pump energy
IMPERIAL CHEM INDS LTD 03.04.80-GB-011384
(14.10.81) C02f-03/02

18.03.81 as 301161 (295AT) (E) GB1025771 US3103488 DD-104280 E(BE DE FR GB IT NL SE)

Waste water is treated by flowing it through a downcomer which is connected at its lower end to a riser. Oxygen is added to the water as it passes through the downcomer. Waste water is continuously supplied to the top of the downcomer and water from the riser enters a header tank from which a portion of the treated water is recycled to the top of the downcomer. The hydrostatic pressure at the bottom of the riser is controlled by adjusting the depth of water in the header tank. This depth is controlled by a weir which may be manually or automatically regulated.

The appts. treats waste water including domestic sewage, farm effluent or food factory wastes. Adjusting the hydrostatic head on the waste water enables the required treatment to be provided while minimising the energy consumed in pumping the liq. (15pp)

Purificn. of water by up-flow through sludge in decanter - with intermittent sudden downflow by change in hydrostatic level

GHEZAIL F 12.03.80-FR-005543
(18.09.81) B01d-21 C02f-01/52

12.03.80 as 005543 (448AS)

A process and an installation for the purificn of water etc the process is of the type in which the water, pretreated with additives as required, is introduced into the lower part of a decantation tank in which the water rises through a bed of sludge.

Improvement is that the water is fed continuously into a compartment below a perforated partition in the base of the tank. Water rises through perforations except when periodically flow is reversed so that a selected vol of water flows suddenly downwards through the partition perforations. The sudden downflow is pref caused by an abrupt change in the hydrostatic level of water in the decantation tank.

Used for the purificn of water esp for drinking and industrial purposes. Highly efficient decanting is achieved. (11pp)

WILL-★ D15 78203 D/43 ★GB 1600-749
Liq. dispensing system for water treatment - has hydraulic piston cylinder unit reciprocating ram in sludge cylinder synchronously with metering pump supplying additive

WILLETT T & CO LTD 22.07.77-GB-030813
Q56 (21.10.81) F04b-13 F04b-15/02 F04b-23/06

03.05.78 as ----- (973DH)

The system comprises a main pump cylinder (10) containing a ram (12) which is connected to, or forms part of, a piston of a hydraulic cylinder (14). The cylinder (14) reciprocates the ram vertically. The main cylinder is connected via inlet (15) to an inlet chamber (16) housing a loose ball (18) above a seat (20) connected to the sludge supply.

The upper end of the main cylinder is connected via outlet (24) to a ball chamber (28) having a sludge outlet (30) connected to a filter press. An upward stroke of the ram draws outlet ball (32) onto its seat and lifts inlet ball (18) off its seat so that so that sludge flows into cylinder (10). On the return stroke the reverse

occurs and the sludge is ejected through outlets (24,30) and additive is supplied. (7pp Dwg.No.2)

Appts. for sepg. liq. e.g. muddy water - includes filter unit in upper space of main pptn. chamber to filter off suspended solids

TANII KOGYO KK 19.02.80-JP-019953

J01 (10.09.81) B01d-21/02

19.02.80 as 019953 (26AS)

Device for sepg. a liq. such as muddy water drained from a civil engineering site, without discharging into a river, comprises a portable tank sectioned into a pre-pptn. chamber, main precipitator, and filtrate chambers arranged in this order.

Improvement is that a filter unit is provided in an upper space of the main pptn. chamber to filter off suspended solids contained in the water. The supernatant of the filtrate is discharged outside and reused for the engineering work. Scraper plates and screws are disposed in the chamber to forcibly drain the pptd. solids. Treatment is inexpensive and fully automatic. (7pp)

SUMH ★ D15 78612 D/43 ★ J5 6115-608
Continuously operating filter for aq. effluent - has screen of inner tube higher than that of outer tube

J01 (10.09.81) B01d-23/14 B01d-33

20.02.80 as 019058 (26AS)

Device for continuously filtering waste water contg. suspended solids, such as industrial waste waters, comprises an inner tube having a wire net screen at the bottom, an outer tube also having a wire net screen, and a tank, in which both tubes are coaxially arranged to form a pptn. chamber in the inner tube, a filtering bed formed between both tubes and a filtrate water chamber between the outer tube and housing. A rake is turnably disposed beneath the filtering bed and pptn. chamber to drain the suspended solids and satd. filtering medium.

Improvement is that the screen of the inner tube is placed higher than that of the outer tube to allow the filtering bed to lower continuously. (4pp)

SUNH ★ D15 78613 D/43 ★ J5 6115-609
Filter for treatment of sewage etc. - has rectangular moving bed filters with raw water receiving stations at side of each bed for increased filtering surface area

SUNDSTRAND CORP(SEKI-) 20.02.80-JP-019059

J01 (10.09.81) B01d-23/14 B01d-33

20.02.80 as 019059 (26RP)

A device for filtering continuously dirty water such as sewage and industrial waste waters, contg. suspended solids, comprises filtering units, each having a moving bed formed between two vertical plates. The object is to increase the effective filtering surface area, relative to a limited installation area.

The novelty is that each moving bed of filtering medium is rectangular shaped. The device has a raw water receive section at one side of each bed and a filtrate receive section at the other side. A raw liq. inlet wire net is attached at one side of each bed and a filtrate drain wire net is at the other side. The latter net is lower than the former. A rotary filtering medium drainer is disposed below the beds. (4pp)

Removal of impurities from condensate - by passing through column packed with cation and anion exchange resins

EBARA INFILCO KK 15.02.80-JP-017295

J01 (10.09.81) B01j-47/04 C02f-01/42

15.02.80 as 017295 (34BZ)

Removal of impurities from condensate for re-use as water to be supplied to a boiler etc. is by passing through desalination tower packed with ion exchange resin. The improvement comprise packing a cation and anion exchange resins mixt. in the tower and introducing the condensate to be treated into the tower from an intermediate distributor provided at an intermediate part of resin layer. The treated water is discharged from a collector provided at the bottom of the tower in ordinary case, or by carrying-out a switching-over of the introduction of the condensate from a distributor provided at the top of the tower in case of condensor leakage to obtain continuously the treated water.

The leakage of Na(+) or Cl(-) is very little even after NH₃ breakage due to the fact that Na-type strong acidic cation exchange resin and Cl-type strong basic anion exchange resin are not contained in a resin layer positioned lower than the intermediate distributor. Further the treated water has excellent quality without any decrease in its amt. even in case of condensor leakage. In ordinary case, the introduction of the condensate is contained even after NH₃ leakage in the treated water. (6pp)

KAWJ ★ D15 78636 D/43 ★ J5 6115-685
 Detoxifying cyanide liquor obtd. by absorbing hydrogen cyanide - in alkali, by oxidising using ozone followed by hydrolysing
KAWASAKI HEAVY IND KK 19.02.80-JP-019583
E36 (10.09.81) C02f-01/78
 19.02.80 as 019583 (34RH)

A cyanide liquor resulting from absorbing HCN gas used for fumigation of banana and other green fruits etc. in aq. alkali soln. is detoxified without using any valuable chemical agent or necessitating any complicated pH-adjusting means by contacting it with O₃ gas to oxidise NaCN or KCN to NaCNO or KCNO, and subsequently hydrolysing it at comparatively lower temps. (ordinary temp. to 60 deg.C) to give bicarbonate and ammonia.

In a modification, the O₃-treated NaCN-contg. aq. soln. is further contacted with O₃ gas prior to hydrolysing treatment to improve the hydrolyses rate and to shorten the decomposition time of NaCNO or KCNO. The stoichiometric amt. of O₃ necessitated for the oxidn. of NaCN to NaCNO is 1.78 pts. per 1 part of HCN, but the practical amt. of O₃ is found to be 1.45-1.60 pt. per part of HCN where gas-liq. contact efficiency is excellent and O₃-utilisation rate is almost 100%. This may be due to decomposition of oxygen by the action of energy resulting from decomposition of O₃. (5pp)

ASAG ★ D15 78637 D/43 ★ J5 6115-692
 Solidification of sludge or its incinerated residue - by adding cement and alkali resistant glass fibre for excellent mechanical strength etc.

ASAHI GLASS KK (DNII DNIN) 20.02.80-JP-019087

Upflow anaerobic filter surrounding septic tank - with overflow weirs permitting filter by/pass in case of blockage

GREEN A W 30.04.80-US-145243
(06.10.81) C02f-03/28

30.04.80 as 145243 (295DH)

Septic tank has an inlet for raw sewage and an outlet for effluent. An anaerobic filter surrounds the tank and is composed of a bed of surface contact material including void spaces for filamentous zoogloea growth. The inner boundary of the filter is defined by the septic tank, and its outer boundary by a device for retaining the surrounding earth. This prevents fine aggregates from entering the filter.

The effluent outlet is connected to a perforated distribution line which delivers the effluent to the bottom of the filter. A perforated discharge riser is positioned opposite the distribution line and collects effluent which has passed through the filter. Overflow weirs permit bypass of the filter in the case of blockage. The weirs are connected to a gaseous vent.

Used for secondary treatment of waste from a septic tank. Biological heat is retained. The upflow filter is installed in the same hole as the septic tank and this reduces costs. The filter may be added to an existing, failed septic tank drainfield. (8pp)

Liq. circulation device submerged in liq. - includes large bubble generator feeding open ended vertical stack pipe

ATARA CORP 05.07.79-US-054826 (15.01.79-US-003707)
(06.10.81) B01f-03/04

05.07.79 as 054826 C.I.p 4187263 (295HM)

Device for creating circulation in a body of liq. includes a vertical stack pipe wholly submerged in the liq. and having an upper discharge and a lower inlet. A large-bubble generator is positioned adjacent the stackpipe and consists of a gas accumulator chamber with a bottom opening.

A vertical standpipe is also positioned adjacent the stack pipe and is connected for fluid flow to the top of the accumulator chamber by an inverted siphon. Gas under pressure is delivered to the accumulator chamber. A transverse gas flow conduit interconnects the upper end of the standpipe and the stack pipe. There is a secondary liquid inlet into the transverse conduit.

For the agitation of large standing bodies of liquid e.g. in anaerobic sewage systems. (10pp)

USAS ★ D15 79591 D/43 ★ US 4293-522
Oxidn. cell for oxidising organic carbon in aq. soln. - uses UV radiation to generate oxygen in situ

NATAERO & SPACE ADMIN 21.05.79-US-041145
J04 S03 (06.10.81) G01n-31/12

21.05.79 as 041145 (67AT)

Oxidn. cell for oxidising organic C contained in aqs. soln. comprises a chamber contg. the aqs. soln. and a UV radiation source in radioactive communication with the aqs. soln. An electrolytic cell adjacent the chamber electrolyses water and forms a barrier which maintains the aqs. soln. within the chamber. The cell has an anode adjacent the chamber, a solid water impermeable electrolyte in contact with the anode and a cathode in electrical contact with the electrolyte. H_2 is removed from a H_2 cavity adjacent the cathode.

Used for determining organic C in aqs. soln. O_2 is generated in situ, thus dispensing with air or other O_2 sources. The aqs. soln. can be supplied continuously to the chamber and returned to its source after the organic C determination. (9pp Dwg. No.1)

THME ★ D15 79594 D/43 ★ US 4293-527
Extraction of uranium from sea water - using adsorber sheets subsequently wound on hollow bobbins for elution

THERMO ELECTRON CORP 14.05.80-US-149866
E31 J01 M25 (06.10.81) C02f-01/28

14.05.80 as 149866 (295DH)

Uranium is extracted from sea water using adsorber sheets which are moved through a current of the water to absorb the uranium. The sheets are wound on perforated hollow bobbins to form rolls from which the uranium is eluted by passing eluant from inside the bobbins through the rolls.

Pref. the sheets are arranged horizontally in the current and are moved vertically. The process is pref. carried out continuously. The system extracts uranium from sea water and is pref. housed on a platform located just off shore. The loaded eluant is stored in a tank prior to transportation to an onshore plant for uranium recovery. (11pp)

US4022665 E(AT BE CH DE FR GB IT LI LU NL SE)

material comprises first degrading the material to water-soluble rods, and lower fatty acids in a prim. reactor. These acids and their water-soluble organic and inorganic materials are removed by rinsing with an aq. liq. and the resulting soln. passed to an auxiliary reactor where conversion to CO₂ and methane takes place. The residue left in the prim. reactor is finally recovered as a stabilised compost.

Each auxiliary reactor is associated with several primary reactors, which are loaded intermittently and effluent from the auxiliary reactor is used as rinsing liquid. Rinsing is stopped as soon as methane generation starts spontaneously in the primary reactor. By removing acids etc. a much more efficient anaerobic conversion is achieved because the pH never falls so low as to inhibit the microbial flora. No contamination of the methane-generating reactor with undegraded material from the first stage occurs. (16pp)

Determining bacterial concn. by luminescence - of extracted
reactive microbial material sepd. from reactive material
extracted from non-microbial cells

PLAKAS C J 31.01.77-US-764180

B04 H04 S03 (21.10.81) *DE2804-117 C12q-01 G01n-21/76

30.01.78 as 003608 (965MR)

Detection of the presence of cells (I) in a sample comprising a mixt. of cells (I) and cells (II) comprises rupturing the walls of (II) to extract their reactive material content (IV) which is then removed. The walls of (I) are then ruptured to extract their reactive material content (III) which is then combined with a luminescence-causing reagent to generate light as a function of the amt. of (III) combined. The light generated is monitored.

Prof. the walls of (II) are ruptured using an enzyme and (IV) removed by placing the sample in a filter of appropriate pore size to hold (I). (IV) is rinsed through the filter. Prof. the walls of (I) are ruptured by contact with an extractant viz ether, acetone, CH_2Cl_2 , HNO_3 or dioctyl sodium sulposuccinate.

The process is more sensitive than the prior art. It is esp. used for determining microbial reactive material by bio- or chemiluminescence. (9pp)

PLAK/ D16 57199 A/32 = GB 1601-082
Determining bacterial concn. by luminescence - of extracted reactive microbial material sepd. from reactive material extracted from non-microbial cells

PLAKAS C J 31.01.77-US-764180

30.01.78 as 026055 Div ex 1601031 (965MR)

Detection of reactive material (I) from cells (II) in a sample (III) comprises rupturing (II) and extracting (I) from (III). (I) is then combined with a luminescence-causing reagent to generate light of intensity that is a function of the amt. of (I). The curve of the function gives 2 values of amt. of (I) for low light intensities.

A first test is run, of a given amt. of (III) to determine the light intensity. If the light intensity is low and hence ambiguous range, the amt. of (III) used is changed and a 2nd test run. If the tests have a negative slope of change in amt. of material to change in intensity, the lower of the 2 values obtd. in the first test is recorded. If a positive slope is obtd., the higher is recorded. Pref. (II) are microbial cells and are ruptured by heat or ultrasonics.

The sample may be e.g. milk or blood. The presence of a relatively small number of microbial cells in a sample may be detected. (6pp)

23.10.79 as 135884 (140PW)

Antibiotic XK-213 of formula (I) is new. Properties of (I) are (a) appearance: white power or crystals, (2) melting pt.: 260 deg.C (decompsn.), (3) PMR (CD3OD) delta (ppm): 2.95-3.25 (2H), 5.99 (1H, t, J = 1.5), 6.22 (1H, d, J = 5.9), 6.28 (1H, d, J = 5.7), 6.45 (1H, dd, J = 3.8, 5.7), (4) CMR (DMSO-d6) delta (ppm): 171.8, 161.8, 142.7,

C10H9NO5, (6) specific rotatory powder: (alpha)D25 = 400 deg. (c = 0.1, methanol), (7) given UV spectrum, (8) IR spectrum (KBr) cm-1: 3500, 3300, 1740, 1685, 1650, 1600, 1400, 1360, 1325, 1285, 1270, 1110, 1090, 1065, 1020, 1005, 915, 840, 785, 770., (9) solubility: soluble in water, methanol, DMF, insol. in ethyl acetate, ethyl ether, n-hexane, (10) colour reaction: false positive in ninhydrin reaction.

Prepn. comprises cultivating an XK-213-producing strain belonging to the genus Streptomyces (specifically Streptomyces MK-213, FERM-P No.5229) and recovering XK-213 from the culture.

XK-213 is useful as antibiotic and antitumour agent. (8pp)

LIOY★ D16 78648 D/43 ★J5 6115-712
Orally administrable compsn. e.g. dentifrice - contg. propylene glycol and sorbitol together with dextranase

LION DENTIFRICE KK 20.02.80-JP-020283

A96 B05 (11.09.81) A61k-07/28

20.02.80 as 020283 (42KB)

Compsn. (I) contg. propylene glycol (II) and sorbitol (III) with dextranase is new. To prevent formation of tartar, a cause of dental caries, dextranase is added in an orally administered compsn. such as dentifrice. But dextranase is easily decomposed by the actions of water and anionic cpds. in the compsn., losing its activity. (I) was derived from the finding that the addn. of (II) and (III) in (I) stabilises dextranase. (I) is used as dentifrice, tooth powder, tooth paste, mouth wash, gargle, troche, etc.

The wt. ratio of (II)/(III) used is 1/6-1/60. The content of (II) in (I) is 1-5wt.%. Other polyalcohols such as glycerol, polyethylene glycol, xylitol, mannitol, etc. is used with (II) and (III). The amt. of dextranase added in (I) is 100-100,000 unit/g-(I), e.g. (1000-50,000 unit/g-(I)), where 1 unit of dextranase decomposes dextran into 1 microgram of glucose in one min. The addn. of alkali metal monofluoro phosphate is also effective for stabilisation of dextranase. (5pp)

Monacolin K or ML-236B derivs. prepn. - useful to prevent and treat hypertrophy

ENDO A 19.02.80-JP-019386

B04 (11.09.81) A61k-31/36

19.02.80 as 019386 (108BZ)

Preventative and treating agent for hypertrophy contains as active component monacolin K or ML-236B or deriv. thereof. ML-236B produced by Penicillium citrium, monacolin K produced by Monascus tuber.

Derivs. of ML-236B and manocolin K are carboxylic acid, carboxylic acid ester, metal salt of the carboxylic acid and amino acid salt. The derivs. are known to have very low toxicity and to have cholesterol-lowering activity. These cpds. show excellent effect in the prevention and treatment of hypertrophy.

Monacolin K carboxylic acid or ML-236B carboxylic acid is prepd. by neutralizing the monacolin K carboxylic acid metal salt or ML-236B carboxylic acid metal salt. The metal salt is prepd. by saponification with weak alkali. The metal salts are alkali metal salt (sodium, potassium), alkaline earth metal salt (calcium magnesium), aluminium salt, iron salt, zinc salt, copper salt, nickel salt, cobalt salt. Partic. suitable are alkali metal salt, alkaline earth metal salt and aluminium salt. The amino acid salt of monacolin K or ML-236B is prepd. by contacting monacolin K carboxylic acid or ML-236B carboxylic acid with amino acid. Amino acid salts are arginine salt, lysine salt, histidine salt etc. The monacolin K carboxylic acid ester is new cpd., and is prepd. by reacting monacolin K with alcohol in the presence of catalyst such as hydrochloric acid or sulphuric acid. The dosage is 0.5-1,000 mg/Kg/day. Admin. is orally, intravenously or intraperitoneally. (4pp)

Enzyme electrode for determining urea - comprises urease-fixed photohardened film with ammonia electrode for excellent flexibility and strength

AGENCY OF IND SCI TECH 18.02.80-JP-019541

A96 B04 J04 (11.09.81) C12n-11/08 C12q-01/58 G01n-27/40

18.02.80 as 019541 (50RP)

The enzyme electrode is produced by joining urease-fixed photohardened film of photocrosslinking deriv. in which at least part of hydroxyl gps. in (partially) saponified polyvinyl acetate is substd. by group of formula (I), (where R is H atom, (un)substituted alkyl or aralkyl, X(-) anion, m 0 or 1, and n integer of 1-6), with ammonia electrode.

Partially or completely saponified polyvinyl acetate used has degree of polymerisation of 400-3000 and more than 75% rate of saponification. Urease is mixed into aq. soln. of the photocrosslinking resin, and the soln. is flowed on e.g. glass plate and dried, forming an urease-fixed film. The film is closely stuck onto ammonia electrode, forming an enzyme electrode.

As urease fixed on the photohardened film is very stable for long period and the fixed film has excellent mechanical strength and flexibility, the enzyme electrode can retain stable output potential for long period. The concn. of urea in living body fluid can be accurately determined by the electrode. (7pp)

Antibiotic complex, BU 1975, was produced by *Bacillus circulans* l.var.croceus C 308-B4 (FERM-P 2230), l.proteophilus C 436-B1 (FERM-P2231), or l.biotinicus C 532-B2 (FERM-P 2232). Components C-1(4'-deoxyambutyrosin) and C-2(4'-deoxyambutyrosin B) could be sepd. from the complex. They were effective against gram pos. and neg. bacteria esp. against *Klebsiella pneumonia* A 20680 and *Escherichia coli* A 20683. C-1 and C-2 were white amorphous solid bases, sol. in water, slightly sol. in MeOH and EtOH, and insol. in n-BuOH and Me2CO. They are positive to ninhydrin and anthrone but give negative reaction in Tollens, Fehling, and Sakaguchi's reagents. LD50 of C1 was 1 g/kg. in mic (admin. intravenously).

Strain C 532-B2 was cultured (with shaking) at 28 deg.C. for 6 days in a medium contg. soybean powder 3, corn starch 2, CaCO3 1, and MgSO4.7H2O 0.33%. The antibiotics in the culture filtrate were adsorbed on Amberlite IRC-50 (NH4+) eluted with 1 N NH4OH, conc., and extd. with n-BuOH. Component B was obtained by evapn. The water phase of BuOH extn. was concd. and passed through a column of Amberlite CG-50 (NH4+). A1 (ambutyrosin A), A2 (ambutyrosin B), C1, and C2 were eluted with 0.5 N NH4OH in this order. Purified C1 and C2 were obtained in 180 and 120 mg. yields, resp., from 17 l. culture broth by repeated chromatography on CG-50. (J49066891) (17pp)

Diagnosis of destructive process in urinary tract tissues - by laboratory determination of endogenic phospholipase enzymes activities in blood and urine samples

MOSC PAEDIAT CHILD 06.04.79-SU-749151

B04 S03 (S05) (30.01.81) G01n-33/48

06.04.79 as 749151 (1471VE)

The accuracy of the diagnostic method for the active destruction process in the tissues of the urinary track is improved by determining the activity of endogenic phospholipases A and C in blood and urine the samples.

Blood serum or urine sample is extd. with 6% EtOH and centrifuged. The residue dissolved in distilled water or 0.13% albumin soln. is introduced in the small cavities of egg-agar plate, prepd. in an acetate buffer (pH 5) for the determination of phospholipase A activity or in borate buffer for the determination of the phospholipase C activity. The Petri dishes with the protein-enzyme mixt. are kept at 50 deg. C for 20 hrs. and the results are evaluated from the diameter of the circle formed around the small cavity. The characteristic sign for the phospholipase A is lightening around the cavity and for the phospholipase C darkening of the circle. The phospholipase C is inactivated by 0.1 mM CaCl₂ and heparine soln. The presence of heparin is necessary for the differentiation of the phospholipase A and C activities in their mixts. The activities can also be determined by a modified Grossman method and by a reaction with licetoviline. The modified Grossman method is carried out by dissolving a substrate from egg yolk in borate buffer pH 7.3 with added detergentatriton X-100, Ca²⁺ ions and heparine and equilibrating the mixt. in test tubes at 50 deg. C. The protein-enzyme mixt. is added to the test tubes and the reaction allow to proceed for 10 minutes, then stopped by addition of a 2:1 mixt. of CHCl₃ and MeOH. Ethanolamine and phosphoethanolamine are determined in the aq. phase by high voltage electrophoresis.

The losses of the substrate and the growth of diglycerides are determined in the chloroform phase photocolourimetrically. The amount of phospholipase C is given by the substrate losses in microM in the daily amount of urine and in standard body surface.

Rotary appts. for shaking culture - with device measuring culture growth over period of time

OHTAKE WORKS CO 31.01.79-JP-009174

S03 (06.10.81) C12q-01/06

28.01.80 as 116184 (295AT)

A rotary, shaking and culture measuring appts. includes an inclined turntable carrying radially spaced culture-contg. vessels. The vessels are L-shaped and have an upright portion disposed parallel to the turntable axis and lateral portion parallel to the turntable. On rotation the culture is stirred by a combined gravity and centrifugal force.

The turntable includes conc. detection openings, with a conc. measuring device positioned adjacent the turntable and consisting of a light source and detector operable with the openings to produce a signal indicative of the culture concn. A synchronising device is also positioned adjacent the turntable to detect the passage of the culture vessel past a predetermined position and produce a signal for synchronising the concn. measurement as the vessels successively pass the concn. measuring device.

The appts. measures and records, with lapse of time, the degree of growth of various microorganisms as they are shaken and cultured in culture tubes. (6pp Dwg. No. 2)

Sequential synthesis of DNA - for prepn. of long double stranded DNA sequences of defined compsn.

CETUS CORP 25.05.79-US-042403

B04 (06.10.81) C12n-15

25.05.79 as 042403 (1248HM)

Prodn. of a cloning vector contg. a synthesised gene of a predetermined compsn. and length comprises the prepn. or selection of a cloning vector having a single restriction enzyme recognition sequence for a restriction enzyme that cuts at a site outside the sequence. A chemically synthesised fragment of double stranded DNA corresp. to a preselected portion of the gene is inserted in the cloning vector at the site cut by the restriction enzyme recognised by the sequence.

The cloned vector is placed in a host and kept under growth conditions for the host to amplify and purify the fragment. Then these synthesis, insertion and amplification steps for preselected portions of the gene immediately adjacent to the previously cloned fragment until a gene is complete.

The procedure permits synthesis of long double-stranded DNA sequences of defined compsn. Synthesised DNA can be inserted at the end of the linker without disturbing the recognition sequence. (7pp)

Filters for tobacco smoke are made of fibrous thermoplastic material, e.g. polypropylene film split into fibres, in a strand consisting of thicker fibres with a longitudinal orientation, and thinner fibres (fibrils) between them with an oblique orientation. This strand is guided along a drum with needles on its circumference in offset rows. This has the effect of severing the oblique fibres and of splitting the thicker longitudinal fibres into further fibrils. Before or after the drum operation, the strand is curled.

Such a strand combines a low packing density with a good filtering efficient and is suitable for use as a tobacco smoke filter. PS (6pp)

KANEBO KESHOHIN KK (MITU) 15.02.80-JP-018155

E19 (11.09.81) A61k-07

15.02.80 as 018155 (42AS)

Cosmetic (I) contg. a peptide of formula

A-Pro-B-C-D-E (II)

is new. A is H, benzoyl, l-adamantantyl carbonyl or dansyl; pro is L-proline; B is L-leucine, L-phenyl alanine, L-methionine, L-cystine, L-glutaminic acid, L-tryptophan or L-tyrosine; C is glycine, sarcosine or proline; D is L-proline or pyrrolidine; E is hydroxy, lower alkoxy, aralkyloxy or amino; and when D is pyrrolidine, E is not present.

(I) has a good skin-protecting effect, does not stimulate the skin, and is used as lotion, cream, powder etc. Pref. (II) is produced by condensn. reaction between aminoacids and/or peptides after protection of the amino and/or carboxyl gps. that are not used for the reaction. (6pp)

KANE- ★ D21 78645 D/43 ★ J5 6115-708
Skin-protecting cosmetic - contg. peptide produced by condnsn. of aminoacid s, compsn. may also contain e.g. alcohol or fatty acid

KANEBO KESHOHIN KK (MITU) 15.02.80-JP-018156

E19 (11.09.81) A61k-07

15.02.80 as 018156 (42AT)

Cosmetic (I) contains a peptide (II) of formula A-B-C-D-E-F-OH, where A is H, benzoyl, acetyl, formyl, tosyl or phthaloyl; B is glycine or L-proline; C is L-proline; D is L-phenyl alanine, L-glutamic acid, L-isoleucine, L-leucine, L-valine, L-lysine or glycine; E is glycine or phenyl alanine and F is L-proline.

(II) is produced by condensn. of amino acids and/or peptides after protection of the amino and/or carboxyl that are not used for the reaction. Pref. (II) comprises compsn. where A is H, benzoyl, acetyl, formyl, tosyl or phthaloyl; B is glycine residue; C is L-proline; D is L-phenyl alanine, L-glutamic acid or L-leucine; E is glycine and F is L-proline. The content of (II) in (I) should be 0.001-1wt.%. For prepn. of liq. (I), (II) is dissolved in a solvent e.g. alcohol or fatty acid.

(I) has good skin-protecting effect. (I) does not stimulate skin, and may be used as lotion, cream, powder, etc. (6pp)

DIAS- ★ D21 78646 D/43 ★ J5 6115-710
Nail enamel which can be peeled off - obtd. by mixing pigment and pptn. preventing agent with viscous polymer that forms an elastic film

DIA SEIYAKU KK 15.02.80-JP-018168

A96 G02 (11.09.81) A61k-07/04

15.02.80 as 018168 (42RH)

A nail enamel (I) is claimed which is prepd. by mixing pigment

forms an elastic film, is new.

As examples of (II), synthetic rubber, acryl resin, polyurethane resin, low-density polyethylene resin, and polyisobutylene resin, e.g. (styrene-butadiene rubber), are listed.

In order to remove painted (I), (I)-removing liq. has been used. The (I)-removing liquid roughen nails and fingerskin because it is usually composed of organic solvents. Recently adhesive films or plastics having a nail enamel layer on one of its surfaces have been developed. This can be peeled off without use of (I)-removing liq., but it is troublesome to cut the film adjusting the shape to each nail. The present (I) is painted on nails and then can be peeled off as occasion demands. (2pp)

 16.02.80 as 018166 (96AT)

Decolourising and deodourising gas, comprises mixing reductive malodorous gas from pollutant treating plant and gas contg. unreacted ozone formed by decolourisation and cleaning of water used for treating pollutant, with ozone, and treating the mixed gas by contacting it with alkaline activated carbon suspension, then with soln. contg. oxidising agent and finally gas-solid contact with activated carbon.

The method comprises washing using first, second and third washing zones, and a granular activated carbon packed layer. Reductive malodorous gas is introduced into the first zone of the washing appts., together with unreacted ozone to remove ammonia and trimethylamine. The gas released from the first zone is fed into the second zone where gaseous hydrogen sulphide is absorbed into alkaline activated carbon suspension and oxidised in the presence of unreacted ozone and molecular oxygen. The alkaline activated carbon suspension contg. thiosulphate ions formed by oxidn. of hydrogen sulphide is fed to alkaline activated carbon suspension prepn. chamber. The gas leaving the second zone is supplied to the third zone, where thioether contained in the gas is oxidised with sodium hypochlorite soln. and removed. Gas released from the third zone is exhausted into the air through activated carbon packed layer, where 0.5-2 ppm of oxidative gas contg. chlorine and unreacted ozone formed by decomposition of oxidising agent at the third zone is removed.

The process considerably reduces consumption of both activated carbon and oxidising agent, and exhibits good effect for deodorisation of discharging waste water and redn. of COD. (4pp)

20.12.72 as 127952 (DH)

An app. composed of an O₃ generator and a catalytic oxidn. tower is useful for purifying gas mixts. contg. oxidisable pollutants. The combination of O₃ and oxidn. catalyst improves the efficiency of the oxidn. process, and thus the appts. is useful for continuous oxidn. of CO in air.

In an example, active carbon (4-6 mesh) was placed in the bottom of a column (100 mm. dia.) to form a O₃ decompsn. bed (approx. 30 mm.), then Al₂O₃-supported AgO catalyst (6-8 mesh) was placed above the active carbon to form an oxidn. bed (30 mm.), and a porous polyester plate was provided at the top of the column.

Then air contg. 40-48 ppm. CO was led into the reaction column from the top conduit while ozonised air was led into the column through the porous plates so that the O₃ content in the mixt. was 60-74 ppm. The CO to CO₂ conversion efficiency was at least 90% when the space velocity of the mixt. through the catalytic bed was max. 2.7 x 10 power 4 per hr. When O₃ was not added, the conversion efficiency was approx. 18% at the space velocity of 2.7 x 10 power 4 per hr. (J49084953) (3pp)

Improving quality of fat from Shorea Robusta - by crystallising from n-hexane, acetone, or mixt. of n-hexane and ethanol

ASAHI DENKA KOGYO 14.02.80-JP-016870
(10.09.81) C11b-07

14.02.80 as 016870 (126RH)

The fat from Shorea Robusta is dissolved in at least 2 times weight based on wt. of fat, of an organic solvent, and the soln. is cooled to crystallise 90-98 wt.% of the fat, and the crystals are sepd. Pref. solvent is n-hexane, acetone, or mixt. consisting of n-hexane and ethanol. The cooling temp. is pref. 0-40 deg.C.

The fat extracted from the seeds of Shorea Robusta contains a large amt. of natural colouring matters and is dark green. Moreover, a characteristic taste is contained in the crude fat. Such colours and taste are removed and the regeneration of the taste of once purified fat is prevented.

In an example, degumming of the crude fat of Shorea Robusta (5.3 acid value and 40.1 iodine number) using 0.2% phosphoric acid and deacidification thereof using 1.25 equivalent NaOH based on the amt. of free fatty acid, were carried out by the usual process. 100g obtd. deacidified fat was mixed with 500g acetone and the mixt. was warmed at ca.50 deg.C while stirring to accomplish the dissolution of the fat completely. It was cooled in a dry ice/methanol coolant to -30 deg.C over ca 2 hr, and maintained for ca 1 hr. at this temp. to crystallise. Crystals were sepd. and washed with acetone cooled to -40 deg.C. 97.6 g crystals were obtd. The crystals were decolourised with activated clay and deodorised by the steam distn. under vacuum. The purified fat was stood for 10 days in an air thermostat at 63 deg.C. By the result of a sensory test (10 person panel) no one detected the characteristic odour and only one person felt the characteristic taste. (4pp)

 12.03.80 as 219599 (200AS)

Liq. glass-cleanser compsn. is prepd. by (a) working an NH₃ soln. into a surfactant or surfactant-alcohol soln. and then (b) reacting with excess MgCl₂ waste liquor. The MgCl₂ waste liquor may be centrifuged or stored before use, to separate opacifying coloured clays. A glass cleanser can contain 0.2-0.4 % anion-active surfactant or surfactant mixt., 25% NH₃ soln., 25% MgCl₂ waste liquor, 0-10% 1-4C alcohols, and water to 100%.

Compsn. is used for cleaning solid glass surfaces, e.g. window panes, mirrors and table tops. Lower alcohol content can be obviated or reduced by adding an inexpensive incombustible material. (5pp)

BADI ★ D25 77899 D/43 ★ DE 3013-292
 Foam suppressor for washing powder - produced by later addition of carrier material after prior agglomeration with part of carrier material

BASF AG 05.04.80-DE-013292
(15.10.81) B01d-19/04
 05.04.80 as 013292 (236RH)

Prepn. of a low-melting foam suppressor in fine particulate form comprises spraying the foam suppressor melt onto fine particles of inert, inorganic support material 0.2-4 pts. wt. of foam suppressor melt and one pt. wt. of carrier material having a mean particle dia. less than 100 micron are used; the carrier particles are at a higher temp. than the m.pt. of the foam suppressor and spraying is carried out until the mixt. agglomerates to particles of dia. 100-1500 micron; there after 0.02-0.3 pts. fine particles having a softening point above the temp. of the mixt. are added and the mixt. is allowed to cool to below the melting temp. of the suppressor.

Used as a foam suppressor for household washing powders where the basic anionic constituents tend to excessive foam prodn. Method enables a low-melting foam suppressor to be produced in a powdered form which has a long shelf life. The later addn. of the quantity of powder, which may be the same material as the original carrier material, results in stabilisation of the agglomerated material. (10pp)

SHELL D25 23360 U/17 = DS 2248-308
 Monoalkylolamides of alpha alkyl branched carboxylic acids - foam promoters in washing compsns

SHELL INT RES MIJ BV 04.10.71-GB-046077
E16 (15.10.81) *NL7213-282 C07c-103/38 + C11d-03/32
 02.10.72 as 248308 (68NS)

New cpds. are alpha- methyl fatty acid- (N-beta hydroxyethyl) amides of formula CH₃-(CH₂)_n-CH(CH₃)-CO-NH-CH₂CH₂-OH (where n = 8-11). Such cpds. may be prepd. by reacting monoethanolamine with an alpha-methylalkanoic acid and heating the resulting amine salt.

Cpds. are useful as foam promoters in cleansing mixts., e.g. for dish washers. PS (4pp)

In a process for washing and bleaching textiles with an aqs. bath contg. a detergent compsn. free of bleaching agents, the bleaching is carried out by incorporation of a freshly prepd. aqs. alkaline oxidising soln. contg. hydrogen peroxide ions at the required stage, the soln. having been prepd. immediately before its incorporation by electro-redn. of oxygen. Plant for carrying out the process is also claimed.

The fresh, in situ. prepd. peroxy ions are more effective for bleaching so that lower temps. are usable and bleaching agent storage problems avoided. Environmental pollution is also lower (than when using perborate bleaches). (18pp)

BADI D25 64303 C/37 = EP G016-344
 Storage-stable aq. zeolite-type aluminosilicate suspension prepn. - by wet-grinding the moist reaction prod. without drying or after adding water

BASF AG 23.02.79-DE-907108

E33 (14.10.81) *DE2907-103 C01b-33/28 C11d-03/12

20.02.80 as 100828 (913MR) (G) DE2333068 DE2412836 DE2412838 DE2615698 DS2744784 DS1218415 DS2447021 E(AT BE CH DE FR IT NL SE)

Storage-stable, pourable and pumpable aq. suspension is produced contg. 20-60 wt.% finely divided, water-insol. aluminium silicates with Ca-exchangeable cations. Aluminosilicates obtd. in aq. suspension after prepn. are sepd. of mechanically (e.g. filtration), and the moist mass is wet-milled with intermediate drying. This is effected either directly or after having added water to bring the coater-content to 80 wt.%. The milled material, where necessary, is brought to the desired solids content.

Pref. starting material is produced by (a) mixing alkali metal silicate and aluminate, alkali metal silicate donor, aluminate donor or aluminium silicate and alkali metal hydroxide in an aq. medium, (b) mixt. passed through a reactor cascade of not less than 2 stages with a total residence time of 0.1-8 hrs., (c) aluminium silicate sepd. from the mother liquor, and (d) mother liquor recycled. Reactants are replenished as consumed so that at no later than the last stage, the molar compsn. corresponds to Me₂O:SiO₂ 1.0-2.5, SiO₂:Al₂O₃ 1.5-2.2, H₂O:Me₂O 25-100. Reaction temp. is 30-100 deg.C with at least the last stage at 80-100 deg.C.

Dispersant and stabilising auxiliaries are not used. The amorphous and crystalline zeolite-type aluminosilicates produced are used as phosphate substitutes in cleaners and detergents, with decreased environmental pollution problems. (10pp)

HENK ★ D25 78029 D/43 ★ EP -37-542
 Foam inhibitor for aq. system, esp. detergent compsn. - is prepd. by mixing branched prim. alcohol with water-repellent silicic acid and heating

HENKEL KG AUF AKTIEN 05.04.80-DE-013391

E17 F09 J01 (F06) (14.10.81) B01d-19/04 C11d-03

28.03.81 as 102369 (200AT) (G) No-citns. E(AT BE CH DE FR GB IT LI LU NL SE)

Anti-foaming agents (A) for aq. systems are prepd. by mixing an 18-30C chain-branched prim. alcohol (I), with a colloidal silicic acid (II), rendered water-repellent, in (I):(II) ratio 100:2 to 100:20 (100:3 to 100:10) and heating to 100-240 deg.C with stirring, pref. in an inert gas atmos. for 1-5 hrs.

Anti-foaming agent (A) use as foam-inhibitors for aq. systems is pref. esp. in detergent and cleansing compsns. but also in paper industry, petroleum extn., sugar refining, textile industry, waste water treatment, cutting oil emulsions, in distn. and flotation. (A) have high foam-inhibiting activity and can be used in small concns., e.g. 0.01-1 (0.05-0.2) wt.% in a washing machine detergent compsns. contg. 5-30 wt.% surfactant. (A) are stable to alkalies and are not inactivated by aq. alkali or surfactant solns. (15pp)

KAOS ★ D25 78139 D/43 ★ FR 2477-874
 Perfume compsn. contg. methyl tri:cyclodecane carboxylate - giving stable, grassy note in detergent, shampoo, soap etc.

KAOSOAP KK 10.12.80-JP-174247 (14.03.80-JP-032435)

E15 (18.09.81) A61k-07/46

11.03.81 as 104885 (1251AT)

Compsns contg ester of formula (I) to impart a grassy note or essence are new. (I) can exist in the exo- or endo- trimethylene forms. (I) is prepn by esterification of the corresp acid with dimethylsulphate, (a) in lower alcohol solvent in absence of acidic or alkaline catalyst, or (b) in aq soln in presence of alkali.

The isomers have slightly different odours; esp exo-(I) has a piney-green-grassy odour and endo-(I) a comphorminty-grassy odour. They can be sepd by fractional distillation. (I) are pref made by gradual addn of aq alkali, esp 10-30% NaOH or KOH at 1-1.2 moles per mole acid, to a mixt of acid and dimethyl sulphate.

(I) are useful in perfumes, soaps, shampoos, acidic or alkaline detergents etc. They have high stability towards acids, alkalis and heat, and do not discolour or decompose during long-term storage. (I) are already known as intermediates for antiviral agents. (10pp)

COOCH₃ (I)

UNIL ★ D25 78171 D/43 ★ FR 2478-123
Dishwashing compsn. contg. sodium triphosphate - of specified moisture and pyrophosphate contents, sodium metasilicate and chlorine bleach

UNILEVER NV 13.03.80-FR-005676

E34 (18.09.81) C11d-07/14

13.03.80 as 005676 (1251MR)

Alkaline compsn comprises 15-70wt % Na triphosphate (I), 15-70 wt % Na metasilicate (II); 1-30 wt % chlorine bleach and opt a surfactant. The new feature is that (I) contains at least 5 wt % water and has Na pyrophosphate (III) content not over 10 wt % based on (I), and no hydrated (III) is present. Pref (I) contains 8-15 wt % water and not over 5 wt % (III), and is esp used as particles completely covered by (I) hexahydrate.

The compsns are made by simply any-mixing the components, esp using (I) which has been hydrated at 40-100 (40-50)deg C then dried for 1-2 hr with air at 50-70 (50-60)deg C.

The compsn are useful in domestic and industrial dishwashers and are storage stable without agglomeration. Bleaches are e.g. 1-5 wt % polychloroisocyanurate type bleaches or 20-30 wt % chlorinated trisodium phosphate type. Pref surfactants are low-foaming alkoxylated alcohols. (8pp)

COLG D25 55126 A/31 = GB 1600-907
Antistatic textile softening compsn. esp. for nylon - contains cationic softener and specified phosphoric acid ester

COLGATE PALMOLIVE CO 28.03.77-US-777994

A60 E11 F06 (A23) (21.10.81) *BE-865-367 D06m-13/32 D06m-13/46

23.03.78 as 011721 (945PW)

Fabric softening and antistatic compsn. comprises (1) 0.1-5 wt.% phosphoric acid ester or salt and (2) 0.1-10 wt.% nonpolymeric cationic softening agent. Cpd. (1) may be

R'O(CH₂CH₂O)_mPO(OM)₂ (I)

(R'O(CH₂CH₂O)_m)₂POOM (II)

ROPO(OM)₂ (III)

or (RO)₂POOM (IV)

where R' is 14-20C alkyl, m is 1-10; M is H, alkali metal or NH₄, and R is 6-10C alkyl. Pref. (1) is a mixt. of (I) and (II) in mol. ratio 4:1-2:3.

Suitably (2) is a quat. ammonium cpd. or imidazolium cpd. The compsn. may be an aq. soln. dispersion or emulsion. It is effective on nylon as well as other materials. (6pp)

ICIL D25 89619 A/50 = GB 1600-981
Liquid detergent compsn. used as washing powder substitute - contg. nonionic polyether surfactant, active additive and dispersant

25.05.78 as ----- (393PW)

Detergent compsn. which is liq. at room temp. comprises a dispersion of 1 or more builders in water-free nonionic liq. surfactant and contains a dispersant for the builder.

Pref. the dispersant is Na or K CMC, a phosphate, Na or K carbonate, a clay, a Na or K borate, Na or K perborate, Na or K metasilicate, Na or K sulphate or Na or K chloride. The surfactant is pref. an alkoxylate of an amide, alkylphenol or alkanol.

The dispersion is partic. stable in the surfactant. (8pp)

RHON D25 87857 A/49 = GB 1601-040
Type 4A aluminosilicate prepn., esp. as detergent additive - by mixing recycle sodium silicate soln. with sodium aluminate soln. in stream esp. in venturi tube

RHONE-POULENC INDUSTRIES 03.06.77-FR-016991

E33 (21.10.81) *BE-867-781 C01b-33/28

31.05.78 as 025810 (924AS)

Prepn. of a crystalline Na aluminosilicate of the 4 Angstrom high cation exchange capacity type comprises mixing a Na silicate soln. and a Na aluminate soln. to form a gel, and crystallising the gel. The mixing is effected by introducing at least a part of at least one of the solns. in line in a recycled liquor flow from the region where the gel is formed before crystallisation.

Pref. Na silicate soln. is introduced into the recycled liquor flow. Specifically, the Na silicate soln. is injected into the axis of a Venturi while aluminate soln. from the region where the gel is formed is injected coaxially into the same venturi. The soln. is recycled from the gel-formation region in such a way that the rate of flow of the recycled soln. is 5-50 times the rate of flow of Na silicate soln.

The prod. has a grain size partic. suitable for producing aluminosilicates for use in detergents. The prod. contains little amorphous material and virtually no hydroxysodalite. (9pp)

*Includes numbered Basics from Weeks D35 (CPI) and D36

Arrangement of Abstracts

'MAJOR' COUNTRIES – An alerting abstract of every basic document is provided, and of examined equivalents from West Germany, Great Britain, Japan, the Netherlands and the United States, and granted and unexamined European and unexamined PCT equivalents. The abstracts are arranged in CPI class order and within any one of the 135 classes are in country and patent number order.

'MINOR' COUNTRIES – Basic headings are included in sequence with the entries from the 'Major' countries.

CPI Section Headings

See inside cover for further details.

A	Polymer Chemistry	F	Textiles, Paper, Cellulose
AE	Polymer & General Chemistry	G	Printing, Coating, Photographic Chemistry

D1: FOOD; FERMENTATION

D11: BAKING

VERS/ ★ D11 79773 D/44 ★ BE -889-239
Deep-freezing of foodstuffs, esp. pancakes - with cooling of solid component before adding liq. component

VERSTRAETEN D 16.06.81-BE-889239
(16.10.81) A231

16.06.81 as 889239 (367JB)

Deep-freezing of foodstuffs comprising a solid or dough-like component and a component which is substantially liq. at the cooking temp. (esp. pancakes) is carried out by (a) cooling the solid component to a temp. such that the liq. component will solidify on contact with it, (b) adding the liq. component, and (c) deep-freezing the prod.

The liq. component is pref. a sauce comprising a fruit juice concentrate, sugar and an alcoholic liqueur. Solidification of the sauce can be promoted by adding a binder, esp. cold-soluble gelatin as described in BE 793847, in an amt. such that the sauce is only liq. above room temp. The solid component (pancake base) is pref. deep-frozen before adding the sauce.

The process prevents the liq. component (e.g. sauce) from soaking into the solid component before freezing. (11pp)

REIM- ★ D11 79926 D/44 ★ DE 3014-741
Liquid esp. liquid fat admixed with powder - by atomising liquid transversely into fluidised bed esp. with turbulence

REIMELT D KG 17.04.80-DE-014741

J02 (22.10.81) A21c-01/14 B01f-03/12 B01f-13/02

17.04.80 as 014741 (236DH)

Method of admixing a liquid to a powder, esp for adding liquid fat or grease to a flour or powdery mixture, consists of blowing the atomised liquid into the powder while the powder is thoroughly pneumatically mixed.

In a preferred arrangement, the liquid is sprayed in transversely to the air flow which maintains the powder in a mixed condition. Turbulence may be produced at the mixing point. The blowing in of the liquid may commence after the pneumatic mixing has started.

A pneumatic mixer consists of a fluidised bed with bottom air inlet grille (14); at a vertical distance above this bottom grille, nozzles (32) spray in the atomised liquid.

Used for mixing fatty or greasy substances with a powder, in the foodstuffs, chemical and plastics industries. Mixing is carried out with less energy consumption, and less heat production than prior art systems. (12pp)

BENC ★ D11 79929 D/44 ★ DE 3014-773
Durum- and soft wheat-contg. noodle improvement - by adding small ortho-phosphate and di-phosphate mixt. proportion to dough

BENCKISER-KNAPSACK 17.04.80-DE-014773

(22.10.81) A231-01/16

17.04.80 as 014773 (200)

Noodle dough and noodles contg. durum and soft wheat contain pref. 0.1-1 (0.3-0.5) wt.% added ortho-phosphates (IA) and di-phosphates (IB). (IA):(IB) ratio is esp. 8:2 to 9.5:0.5 (9:1). The phosphates are esp. K_2HPO_4 and Na diphosphate. Soft wheat content in dough can be up to 50 wt.%. Phosphate activity can be further enhanced by adding emulsifiers, natural protein and ascorbic acid.

Phosphate addn. improves noodle cooking and consumption properties and the rheological properties of the dough. Soft wheat proportion can be increased without lowering quality. E.g. the quality of 50:50 durum- and soft wheat-contg. noodles contg. phosphates can approach that of 70:30 durum- and soft wheat mixt. without phosphate addn. (10pp)

MODE/ ★ D11 80021 D/44 ★ EP -37-972
Packaged bread pasteurisation - with light beam barrier detecting not inflated foil bags

MODERSOHN E 10.04.80-DE-013875

X25 P43 (21.10.81) A21d-15/04 B07c-05/34

02.04.81 as 102485 (39HM) (G) FR1314085 DS1240684 US4024956 FR2209587 FR2281176 DE2535285 FR1235397 FR1538600 US4177620 DE2803035 GB1135011 E(AT BE CH DE FR GB IT LI NL SE)

A continuous pasteurisation system for packaged food, specially bread in inflatable foil bags, uses an endless belt conveyor to pass the packages under a line of heaters. The developed vapour pressure causes the bags to be inflated, if sound. If they reach the

the packages to a track for 'GO' articles. If not, they continue to 'NOT GO' track.

This combines a pasteurisation by heat treatment and detects any foil bags which may have become defective thereby. (19pp) Dwg.No.4)

Machine to grade fish according to size - drops them from channel with divergent gap between rising conveyor belts

TRIOENGINEERING 21.03.80-NO-000818

P43 (25.09.81) A22c-25/04 B07b-13/07

20.03.81 as 005599 (448NS)

Machine automatically grades fish according to size. The machine is of the type in which fish to be graded, are conveyed along a channel or 'V' section. The inclined sides of the channel are formed by surfaces of two, flat conveyor belts. At the base of the channel there is a gap between the edges of the conveyor belts, the width of the gap increasing progressively from the load end to the discharge end of the channel. The complete channel is now inclined to the horizontal, rising from the load end towards the discharge end. The angle of inclination to the horizontal is pref. between 10 and 45 deg.

A fish is no longer able to ride on the back of a bigger one and thus be carried into a grading compartment intended for bigger sizes. There is less damage to fish which drop on to inter-compartment partitions, as they now slide obliquely into the compartment on the upstream side of the direction of conveying.

Artificial fish meat-flake prodn. - by wetting granular vegetable protein with warm alkaline earth metal salt soln., moulding, dehydrating and finally seasoning

NISSHIN OIL MILLS KK 21.02.80-JP-019736

(16.09.81) A23j-03

21.02.80 as 019736 (42AT)

Food (I) resembling fish meat-flake is produced by first wetting granular vegetable protein (II) with warm soln. contg. alkaline earth metal salt (III). The wetted protein is moulded into flakes and washed and dehydrated followed by seasoning.

As (II), the proteins from soy bean and wheat flour are used. The granular size of (II) should be 3-10 mesh. Examples of (III) are sulphates, chlorides, phosphates and organic acid-salts of calcium and magnesium. The conc. of (III) in the soln. used is 0.3-1 wt.%. The temp. of the soln. is 70-100 C. The amt. of the soln.

used is 5-15 times as much as that of (II). The treatment of (II) with the soln. makes (II) glutinous and cutting becomes easy. The flaky (II) is washed for removal of the specific flavour in it, and then dehydrated by centrifugation. Thereafter, edible oil up to 30% and seasonings of 10-30% are added to (II).

The present method makes it possible to produce (I) from cheap vegetable protein. (4pp)

Crab cleaning appts. removes carapace - by conveyor chains with lugs which pivot shell backwards

SMITH C M 24.09.79-US-078036

(13.10.81) A22c-29/02

24.09.79 as 078036 (295NS)

Crabs are advanced, eyes first, along a horizontal surface by a conveyor chain with upstanding lugs which engage the rear of the crabs. An overhead conveyor converges with the crabs but its lower run moves in the opposite direction to the crab conveyor. Lugs on the overhead conveyor engage the forward end of the carapace and further movement of the conveyor pivot the shell about the rear end of the crab, to separate it from the remainder of the body. The removed shell is carried away by the overhead conveyor which traps the shell against guide rods which run parallel with the overhead conveyor. The appts. is claimed.

The carapace removal precedes cleaning of the body cavity and removal of the legs. (16pp)

MOUL/ ★ D12 81613 D/44 ★ US 4294-858
Mfr. of self-surfaced meat product - by pumping emulsion through tube passing through microwave oven, heater and cooler
MOULERE 27.03.80-US-134605
(13.10.81) A23b-04

27.03.80 as 134605 (295AS)

A self-surfaced meat product is formed by delivering an emulsion from a container through a tube at a predetermined rate against a back pressure. The back pressure is created by laterally constraining the prod. as it moves through the tube. The emulsion is subjected to microwave energy as it travels along the tube to congeal it. The tube is heated to melt materials on the outer surface of the product to form a self skin. The tube is subsequently cooled to solidify the outer surfaces of the product and complete the formation of a self skin. The prod. is finally released from the tube. Used for forming a meat prod. such as bologna or salami. The prod. is not formed in a casing which has subsequently to be removed. (7pp)

Refrigerating meat paste to prevent bacterial growth - using cooled drum around which sheet of paste is wound

ROTHEN 14.12.79-US-103498 (07.11.77-US-849166)

(13.10.81) A23b-04/06 A23l-01/31

14.12.79 as 103498 (+ 18.12.78-US-970579) (295NS)

A protein-containing solids food is formed into a viscous paste which is applied to the cylindrical surface of a rotating drum cooled to a temp. at or below freezing. The relative temps. of the paste and drum surface are selected so that the paste momentarily melts congealed or frozen liquid along the interface between the paste and drum. The low temp. of the drum surface subsequently causes the liquid components at the interface to form a congealed or frozen solid to cause the viscous paste to

adhere to the drum surface. The sheet of paste is compressed to improve the heat transfer characteristics across the thickness. The paste is finally removed in a frozen condition.

The paste pref. includes minced, rendered materials such as beef, pork, poultry, and even protein materials derived from vegetables such as spinach, squash or soy beans. The rapid cooling prevents undesirable bacterial growth. (9pp)

DEAK ★ D13 79806 D/44 ★ DD -149-842
Protein contg. animal feed prodn. from activated sludge - by partial evaporation of alkaline sludge to eliminate toxins

AKAD WISSENSCHAFT DDR 19.10.78-DD-208553

C03 (05.08.81) A23k-01

19.10.78 as 208553 (1251NS)

Recovery of feed from activated sludge from waste water purifcn. comprises adjusting to pH 8-11 then evaporating or distilling out released toxic and 'anti-nutritional' associated substances together with at least 10% of the water in the suspension.

The sludge can be derived from domestic or industrial wastes, or from animal prodn. (e.g. liq. manure), and is made alkaline with alkali hydroxide or other non-volatile bases. The sludge can be (a) warmed to 90-100 deg.C then passed to an evaporator, (b) treated by steam injection; (c) warming to 105-200 deg.C under reduced pressure, then releasing the pressure.

By destroying or eliminating toxins, the sludge can be used safely as feed over a long period without toxicity problems. (11pp)

FAHR/ ★ D13 79837 D/44 ★ DD -149-901
Raw lactic casein drying - in fluidised bed for coarse and flash dryer for fine particles

FAHR J 31.03.80-DD-220030

(05.08.81) A23j-01/22

31.03.80 as 220030 (39AT)

Raw lactic casein is dried in a fluidised bed after it has been reduced by shear to a particle size to suit the air velocity. The waste air leaving the dryer with the moist fines is fully satd. by steam. The casein fines are passed from the star wheel lock of a cyclone into the ascension pipe of a flash dryer for a final drying operation.

A screw conveyor charges the casein in the grater where it passes through 2mm perforations into a fluidised bed dryer. Air drawn in by the ventilator through the cyclone is preheated by the grilled tube heat exchanger to 130 deg.C. Coarse casein spills over an overflow into the star wheel lock.

This is a very gentle drying process which has a high thermodynamic efficiency and saves the energy consumption for any granulation. (10pp)

SCHM/ ★ D13 79864 D/44 ★ DE 3006-092
Aromatising dried tea-leaves - by spraying with aroma oil and packing in oxygen free atmos. pref. under nitrogen or carbon di:oxide

SCHMITT W 19.02.80-DE-006092

(22.10.81) A23f-03/40

Dried tea-leaves are aromatised by spraying with aroma oil in an O2-free atmos. The aromatised tea-leaves are packed in an O2-free atmos. Oxidn and degradation of the ethereal oils in aroma oils is suppressed.

Spraying and packing take place esp in a gas which replaces air-O2 and is inert w.r.t the aroma-oil and its carriers. The O2-free atmos is generated esp by rinsing with the inert gas, e.g. N2 (prefd) or CO2. The O2-free atmos can contain a residual 2% O2 content, which affects neither oils nor fragrances. Pref aroma oil-propellant also consists of the air O2-replacing inert gas. (6pp)

20.02.81 as 101227 (+8.9.80-US-184689) (513AT) (E) GB2029192 US4113885 US4153613 US4039690 E(AT BE CH DE FR GB IT LI LU NL SE)

Meat, poultry and fish prods. are claimed to which have been added 1000-3000 ppm hypophosphorous acid or Na-, K-, Ca-, Mg- or Mn hypophosphite. The prod. may also contain Na nitrite and may be smoked.

The hypophosphorous acid (salt) may be added to the meat etc. either directly, or added with the pickle in soln. or solid form, or rubbed into the meat or fish.

The hypophosphorous acid (salt) inhibits the growth of *Clostridium botulinum* and formation of enterotoxin in smoked meat, poultry and fish prods., and esp. in smoked bacon. Use of the hypophosphorous acid (deriv.) allows redn. or omission of nitrite e.g. in smoked bacon, and thus reduces the possibility of formation of carcinogenic nitrosamines when cooking such prods. The treatment can also be applied to comminuted meat prods. such as Frankfurters. (25pp)

Prod. of dog food having improved flavour - by mixing enzyme treated protein with fat, carbohydrate, vitamin(s) and mineral(s)
GENERAL FOODS CORP 15.11.79-US-091225
C03 (D16) (11.07.81) A23k-01/18
15.11.80 as 161318 (15PW)

Treated protein is mixed with fat, carbohydrate, vitamin and minerals and the dog foods having a nutritious balance is produced. The protein is reacted with enzyme at 30-70 deg.C and thereby, the enzyme and free amino-nitrogen are removed from the treated protein.

The said enzyme is ficin (kind of papainase) produced from *Ficus carica* L., trypsin, bromelin (kind of protease) produced from *Ananas comosus* Merr., pepsin or papain peptidase. The dog foods has porosity of 25-75 volume percent and it is extruded as a moulding.

Above dog foods contains amino acids such as L-phenylalanine, L-tyrosine, L-tryptophane, L-isoleucine or etc. and the amino acids stimulate the dog's taste. (13pp)

ASAH ★ D13 80427 D/44 ★ J5 6117-753
Drink based on milk - contg. added minerals and/or vitamin(s), and crystalline cellulose

ASAHI CHEMICAL IND KK 22.02.80-JP-020578

(16.09.81) A23c-09

22.02.80 as 020578 (42RH)

Drink (I) contg. milk (II) as principal component, minerals (III) and/or vitamins (IV), and crystalline cellulose (V) is new. (I) is produced by mixing (II), (III), (IV) and (V) and the mixture is sterilized followed by being packed.

Recently poverties of (III)- and (IV) intakes of young people are reported. Although (II) contains much (III), it is necessary for young people to intake more (III) as well as (IV). The addition of (III) in (II) makes the emulsion of (II) unstable, and most of (IV) is hardly emulsified in (II) because of their oily properties. The present composition of (I) is easily emulsified and maintains its emulsion stably for a long period.

As pref. examples of (III), water-insol. and hardly soluble calcium salts are listed. The water-insol. and hardly soluble salts should have solubilities in water at 20 deg.C lower than 0.01 g/100 ml-water and lower than 0.1 g/100 ml-water, respectively. The particle size of the salt should be smaller than 10 micron. Examples of (IV) are vitamin A, D, E, B₁, B₂ and C. The amts. of (III) and vitamins A, B₁, B₂, C and D added are 1-20 g, 1000 Iu, 1 mg, 2-3 mg, 100-500 mg and 1000-2000 Iu, per 1 g of (I). (V) of 0.2-1.5 wt.% is used in (I). (4pp)

UEDA- ★ D13 80433 D/44 ★ J5 6117-771
Frying battery improving agent prodn. - by heat-dissolving lipophilic and hydrophilic emulsifiers in edible oil, adding sugar, water etc., stirring, cooling rapidly and solidifying

UEDA SEIYU KK 21.02.80-JP-021159

(16.09.81) A23l-01/17

21.02.80 as 021159 (5HM)

Method comprises (a) dissolving lipophilic emulsifier and hydrophilic emulsifier in edible liq. oil with heating; (b) adding sugar, water, etc. to the mixt., (c) stirring it to W/O type emulsion; and (d) cooling the emulsion rapidly to convert it to O/W type and solidifying.

The lipophilic emulsifier is synthetic surfactant e.g. fatty acid ester of glycerin, propyleneglycol, sorbitan, and/or natural surfactant e.g. lecithin. The hydrophilic emulsifier is sucrose fatty acid ester, water soluble gum arabic, arginic acid, etc. The edible liq. oil is soy bean, rapeseed, sesame, cotton seed, corn, rice, kapok, vegetable fractionated oils, etc.

By using the improving agent, ca. 10% flour batter, excellent for frying, is prepd. simply by mixing flour, water, improving agent and opt. egg, skimmed milk, shortening, baking powder, etc. The batter has excellent battering and breading properties and fried foods of excellent appearance, we prepd. without puncturing during frying. (3pp)

FUKO ★ D13 80434 D/44 ★ J5 6117-776
Fried bean curd prepn. - by mixing vegetable protein, alkaline earth metal coagulant and bean curd, kneading, moulding and frying mixt.

FUJI OIL KK 23.02.80-JP-022051

(16.09.81) A23j-03 A23l-01/20

23.02.80 as 022051 (5WB)

Method comprises mixing vegetable protein of crude protein (CP) content above 60 w/w% (on dry basis), alkaline earth metal-type coagulant, in amount above 1 w/w% esp. 5-15 w/w% on the CP of

the vegetable protein and bean curd, kneading the mixture, moulding it and frying.

The coagulant can be water insoluble such as calcium sulphate or water soluble coagulant such as calcium chloride, magnesium sulphate, etc. when an alkalisng agent such as sodium hydroxide is required.

Fried bean curd, which has the taste, flavour, texture and appearance of conventional fried bean curd can be prepd. with high productivity and bean curd can be used as it is without dehydration. (5pp)

HAYB ★ D13 80435 D/44 ★ J5 6117-781
Sweet material mfd. - by contacting Momordica fruit extract with magnesium silicon aluminate and recovering material from non-adsorbed portion

HAYASHIBARA BIOCHEM(NICH-) 21.02.80-JP-019741
E33 (16.09.81) A231-01/22 C07h-03/02 C07h-15/24
21.02.80 as 019741 (5WB)

Method involves contacting liquid extract prepd. from the fruit of Momordica grosvenori Swingle, a perennial herb of Cucurbitaceae with magnesium silicate aluminate (Mg-SA) and recovering sweet substance from unadsorbed part.

Spent Mg-SA can be easily regenerated either by washing with dilute alkali soln. and water or by burning it at 300-600 deg.C. The obtd. sweet material contg. glycosides have a sweetness 10-200 times that of sucrose. It can be used as it is or as a concentrate or dried powder. (4pp)

IHAR D13 01379 Y/01 = J8 1042-586
Chlorosulphonyl benzoyl chloride prepn. - by reacting sulphocarboxylic acid with phosgene in the presence of DMF

IHARA CHEM IND 11.06.75-JP-070311
B05 C03 (06.10.81) *NL7603-612 C07c-143/70
11.06.75 as 070311 (TM)

Prepn. of chlorosulphonylbenzoyl chlorides of formula (I): (where X is H, halogen or NO₂) comprises reacting COCl₂ with an aromatic sulphocarboxylic acid of formula (II) or an alkali(ne earth) metal salt thereof, in the presence of DMF.

Cpds. (I) are intermediates for pharmaceuticals, foodstuffs additives and agricultural chemicals. For example, reaction of o-sulphobenzoic acid with COCl₂, gives a mixt. of o-chlorosulphonylbenzoyl chloride and dichlorotolyl sultone, which can be converted to saccharin.

The process gives high yields (e.g. 89-95%) using an inexpensive chlorinating agent (COCl₂). The prods. are pure enough for further conversion. (J51146422) (6pp)

TANA D13 21480 X/12 = J8 1042-640
Antioxidants for oils and fats - contg. dipeptide

TANABE SEIYAKU KK 24.07.74-JP-085493
E16 (06.10.81) *J51013-806 C11b-05 + A231-03/34
24.07.74 as 085493 (MR)

The antioxidant contains a dipeptide (I)

$\text{R1.C}(\text{NH}_2)\text{H.CO.NH}(\text{R2})\text{CH}_2\text{COOH}$

R1 is alkyl 3-4C branched; and R2 is H or methyl, e.g. leucylglycine, isoleucylglycine etc.

The dipeptide (I) has strong antioxidation activity towards oils and fats, and is quite harmless to human body, as it consists of amino acids which are natural ingredients of foods. (J51013806) (2pp)

RENJ D13 62769 A/35 = J8 1042-888
Maintaining freshness of vegetables and fruit - by packaging in EVA copolymer film together with adsorbent for gas

RENGO KK 05.01.77-JP-000287
A92 E36 (A17) (07.10.81) *J53086-058 A23b-07
05.01.77 as 000287 (5DH)

Process comprises packaging vegetables and fruit together with an adsorbent for gas, using a film of thickness 20-50 microns composed of EVA copolymer having a vinyl acetate content of 5-30 w/w%.

The specific vinyl acetate content and thickness ensures that the content of CO₂ gas and steam in the packages is maintained at the right level and that the adsorbent can adsorb the organic gas, e.g. ethylene aldehyde, alcohol, etc. which is released from vegetables and fruit by respiration and causes their deterioration. (J53086058) (4pp)

WAKD D13 06826 B/04 = J8 1042-881
Prepn. of food which is stable under heating in acid - by adding organic acid-polyhydric alcohol ester to a soln. of milk serum protein etc.

WADAKO KK 19.05.77-JP-058051
(07.10.81) *J53142-562 A23c-21/08
19.05.77 as 058051 (5RH)

Method comprises adding organic acid-polyhydric alcohol ester more than 10% to soln. on non-denatured milk serum protein, dissolving or dispersion at least 1 of fat, sugar, emulsifier, organic acid, etc. and opt. powdering by spray-drying, etc.

A liq. which is similar to milk in taste and flavour and appearance can be obtd. and it is not coagulated at heating in under acidic condition. The prod. can be applied for preparing drinks or the ice cakes contg. fruit juice, fermented milk, etc (J53142562) (3pp)

AINS. D13 - 54413 A/30 = J8 1042-899
Cream base compn. for confectionery - is composed of liq gelling base contg. methoxy pectin, organic acid and water, and pasty base of sugar, flour and water

AIN SHOKUHHN KK 04.12.76-JP-145770

Compsn. comprises (a) a liq. gelling base containing low methoxypectin, organic acid and water, and (b) a pasty base contg. sugar, flour and water.

Cream for confectionery use can be obtd. by mixing the gelling base and the pasty base and kneading the mixt. with milk. The mixt. is rapidly gelled and a homogeneous cream with good dimensional stability and texture is obtd. Water does not separate out from the mixt. (J53069859) (4pp)

PERF. ★ D13 80995 D/44 ★ NL 8101-071
Cheese prodn. unit comprising battery moulds - which have outer frame divided into individual moulds each having cross-plate which acts as based as press (SE 5.10.81)

PERFORA ROSSE H A/S 05.03.80-DK-000949

P13 (01.10.81) A01j-25/06

05.03.81 as 001071 (1161PW)

The pressed cheese production unit uses battery moulds which successively pass a filling station a primary turning station, a press, a discharge station, a secondary turning station, and a cleaning section.

Each battery mould comprises an outer frame which is divided into a number of individual moulds by intersecting sepg. walls. The individual moulds each have a cross plate which is limitedly movable, serving firstly as a base and then, after the first turning process, as a press plate for the cheese mass.

This enables the cheese to be collected in the tops of each individual mould and easily removed in the discharge station. (12pp)

05.06.81 as 156688 (478NS)

The aroma or taste of a guava-flavoured foodstuff is augmented or enhanced by addn. of 0.1-0.5 ppm of a mixt. of nor-methyl jasmonate (I) and dihydro-nor-methyl jasmonate (II) (wt. ratio (I): (II) is 50:50). The (I)-(II) mixt. is produced by hydrogenation of (I) at 10-100 deg.C/5-80 psig over 0.1-10% by wt. (of (I) of a catalyst (Raney Ni, Pd/C, or Pd/CaCO₃).

The (I)-(II) mixt. has an excellent jasmine/lactone aroma and taste profile, and is useful for augmenting or enhancing the aroma or taste of guava and other tropical fruit-flavoured foodstuffs. In addn., a mixt. of (II) and methyl jasmonate is useful in augmenting or enhancing the aroma or taste of pear or peach flavoured foodstuffs. (I) per se gives an intense floral/jasmine-like aroma to perfumes, etc. (16pp)

Sludge removal from sewage settling tank bottom - by pusher plates mounted on continuously driven cable
METALLGESELLSCHAFT AG 09.04.80-DE-013541
(22.10.81) B01d-21/18
09.04.80 as 013541 (1480DH)

The sludge which sinks to the bottom of a sewage settling tank is pushed into a lower trough for subsequent removal, with the pushing force provided by a series of spaced continuously travelling transverse pusher plates mounted on an endless cable driven by rollers. Each plate is pivotally attached to the cable by a set of hinged connected inflexible bars which engage the cable at two points, one ahead of, the other behind, the plate.

The system normally uses only one cable and is simpler and lighter than known devices, usually with two chains, esp. for tanks 10 m or more in width. At least the driven roller (10) projects above the liq. surface. At the plate ends are rollers running in channels of L or U shape, depending on the degree of support and control needed. The cable is plastic or high grade steel coated with plastic. (7pp Dwg.No.1)

Composting municipal clarifying sludge - after adding comminuted waste paper shreds as carbon-carrier, swelling and water-extn., facilitates printers ink and heavy metals removal
GEBR WEISS KG 21.04.80-DE-015246
(22.10.81) C05f-09
21.04.80 as 015246 (200MR)

In composting municipal clarifying sludge, waste paper is used as the exclusive C-carrier for setting a C/N ratio suitable for rotting. After comminuting to irregular coarse shreds, the waste paper is added to the non-dehydrated clarifying sludge until C/N ratio is 20:1 to 25:1. The sludge obtd is then swelled 2-10 hrs., dehydrated to 30% solids content and composted.

Waste paper is cheaper and more easily available than the previously used sawdust. The paper shreds and liq. sludge form an easily dehydratable mixt., yielding a higher solids content. In water-extn., the paper shreds absorb suspended materials and act as flocking auxiliaries. The dehydrated mixt can be disposed of as pellets or composted.

Printers' ink on waste paper can be removed by standard flotation e.g. with 3% resin soaps and 1.5-3% cerosine. Heavy metals in sludge can be pptd mechanically, electrolytically and/or chemically. Fresh compost is pref added to the sludge before mechanical water etxn. (7pp)

Enzymatic sludge and liq. manure decomposition - using complexing cpd. together with *Bacillus subtilis*-derived enzyme compsn. contg. protease, amylase and glucanase

FORSCH WASSERTECHNI 07.01.80-DD-218327

(22.10.81) C02f-11/02

04.12.80 as 045712 (200HM)

Organic sludge and liq. manure are decomposed by treatment with a cytolytic *Bacillus subtilis*-derived enzyme compsn., contg. protease, amylase and other enzymes in addn to beat-glucanase, in the presence of a complexing cpd. The prod. is sped into a stabilised odourless sludge and a liq. phase.

Enzyme quantity used is 3-10 mg/l. The complexing cpd. is esp. di-Na di-hydrogen diamine tetraacetate used in a proportion corresp. to 36-70% of enzyme quantity used. Incubation pref. takes 0.5-15 hrs at 10-50 deg C and pH 5-8. Complexing cpd. addn. reduces enzyme requirement to about 90%. Energy consumption is reduced. (6pp)

SIMC D15 79430 B/44 = DS 2960-474
Removal of metallic impurities from sewage sludge - by dissolution with aq. acid and oxidising agent, and sepn. of impurity-contg. liquids

SIMON ENGINEERING LTD 15.04.78-GB-014901

C03 (D13) (22.10.81) *EP--5-011 C02f-11/06

26.03.79 as 960474 Based on EPG005011 (393AT)

Removal of metallic impurities from sewage sludge comprises (a) acidifying the sludge in the presence of oxidising agent to solubilise the metallic impurities, (b) adding flocculating agent and removing part of the liq. component contg. the solubilised metallic impurities, (c) replacing the removed liq. with aq. liq. which is substantially free from metallic impurities, and (d) again removing the liq. component mechanically to remove still further residual metallic impurities.

Pref. the sludge is acidified to pH 1-1.5. Replacement liq. is pref. removed by drainage or sedimentation. Acidification of the sludge is pref. with HCl and the oxidn. agent is H₂O₂.

Method removes ca. 98% of the metallic impurities. (5pp)

FARB D15 23908 C/14 = DS 2960-489
Thin film contact dryer - with swash plates on vertical shaft carrying cylindrical distributor elements

BAYER AG 16.09.78-DE-840481

J01 + Q76 (22.10.81) *DE2840-481 B01d-01/24 C09b-67 F26b-03/26

05.09.79 as 960489 Based on EPG009173 (236AT)

A thin film contact dryer comprises typically a cylindrical vertical column with top inlet for feed, bottom outlet for dried prod. and lateral top outlet for vapour.

A central, vertical-axis rotor carries a number of parallel wobble plates, while between successive plates loosely fitting sweeper discs or devices resting on the plates are in local contact with the inner face of the cylindrical column. Thus as the rotor revolves these sweeper discs tilt up and down, also revolve relative to the wobble plates and sweep every point of the internal surface of the column.

With this arrangement, sticky build-up of the drying prod. at certain stages of the drying process is effectively prevented by the scraping action over the entire internal surface of the column. (5pp)

HAMM ★ D15 79983 D/44 ★ EP --37-88
Oil and water separator having two successive chambers - each with light liq. layer at surface and wide interconnecting duct giving slow movement and self regulation

HAMMERSCHMITT N 23.08.80-DE-023384 (14.04.80-DE 014204)

J01 (21.10.81) B01d-17/02

22.12.80 as 108098 (236MR) (G) FR--86277 DE2853725 CH-542154 D-586728 DE2800061 DS1484845 DS-651986 E(AT BE CH DE FR GB LI LU NL SE)

A method of continuously separating components of a liq. mixt. having different densities, esp. sepg. oil or petroleum from water, uses an inlet chamber for the mixt. and an open-bottomed sepg. chamber penetrating into and below the surface level of the heavier liq.

A substantially constant level of the heavy liq. is maintained by the heavy liq. outlet, and by regulating the inlet and discharge rates. The mixt. entering passes through a floating layer of the lighter liq. and in the lower region of the sepg. chamber additional sepn. and settlement takes place of the lighter liq. from this sepg. chamber liq. passes beneath a comparatively still sepg. chamber before it reaches the downpipe leading to the heavy liq. outlet. Both the chambers have light liq. outlets above the heavy liq. outlet level.

Pref., a preliminary separator is mounted upstream of the first chamber particularly for the sepg. out of sludge.

The sepg. procedure is largely self-regulating and considerably simpler than in previous arrangements. A sepn. efficiency of greater than 97% is achieved. (80pp)

HAMM ★ D15 79991 D/44 ★ EP --37-88
Oil and water separator has two successive chambers - with guide plates in first to increase cross section and reduce flow speed and low level oil alarm in second

HAMMERSCHMITT N 00.00.81-EP-101179 (14.04.80-DE 014204)

J01 (21.10.81) B01d-17/02

22.12.80 as 101179 (236RH) (G) DE2201273 US3862040 GB123402 US2232709 DE2610773 EP--16517 DS1038683 DS-586728 DE285372 E(AT BE CH DE FR GB IT LI LU NL SE)

Continuous sepn. of components of different densities in a liq. mixt., esp. for sepg. oil or petroleum from water, opt. also for sepg. sludge, uses an inlet comprising a bottom-open bell, a downpipe at a distance from the bell for discharging the water and an oil outlet at a higher level than the water outlet. There are also two safety oil overflows.

The liquid mixt., after flowing through an inlet bell or after flowing along guide surfaces (72,73) enters a space of large cross section in which the flow speed is stilled; the oil components ascend on the other side of the guide surfaces (73); the dimensions of the inlet region are such that there is sufficient space as a first sepg. chamber to allow for the max. fluctuations in the water level.

In a pref. embodiment (as shown) the oil is continuously removed from a safety outlet (74) comprising a vessel with sepg. walls, a cranked pipe with height-adjustable oil inlet funnel (79) normal oil outlet (80), a safety oil outlet (81) and a lever mechanism (82,83) for an alarm system. This is connected to a water level outlet (75) at a lower, fixed level, independent of the water level fluctuations, so that when faults occur in the oil outlet (80) the oil column (78) can build up downwards, flow beneath a partition and ascend in a duct (78) leading to the safety outlet (81) and the alarm.

Considerable fluctuations in the inlet level are possible without mixing of the constituents. A high efficiency of sepn. is achieved. (52pp Dwg.No.21)

BADI ★ D15 80041 D/44 ★EP --38-008
Polyacrylate, PVA or CMC size regenerating bath purificn. - by aeration and removal of ppte. formed

BASF AG 11.04.80-DE-013925

A87 F06 (21.10.81) C02f-03/12 D06l-01/14 D06m-15/08

07.04.81 as 102598 (200AT) (G) 1.Jnl.Ref E(AT BE CH DE FR GB IT LI NL)

In purifying the regenerating baths of sizes which are biologically decomposed with difficulty, the bath is aerated, on size recovery, to prevent the molecular O₂ content from falling below 2 mg/l. After aerating for at least 1 day, the ppte. obtd. is sepd.

The sizes are esp. a polyacrylate or PVA size or a CMC size having a degree of substit. over 0.5. Aeration must be initiated before the onset of putrefaction and should be continued until the sizing bath is reqd. for reuse.

Constant bath aeration and ppte. separation remove up to 90% imp impurities. An odourless sizing bath is obtd. which can be used directly, conc. or replenished for re-use. Size properties are unchanged. The process can replace ultra-filtration. (22pp)

SCHD D15 77951 D/43 =EP --38-017
Waste water aeration in equaliser and storage basins - for partial biological degradation of industrial waste water dirt load at constant redox potential

SCHERING AG 10.04.80-DE-013881

(21.10.81) *DE3013-881 C02f-03/02

08.04.81 as 002627 (200HM) (G) DE2326224 DE2820086 E(AT BE CH DE FR GB IT LI LU NL SE)

In the partial biological degradation of an industrial waste water dirt load by aeration in an equalising- and storage basin, aeration takes place at a constant redox potential at m-250 to m-500 mV, at pH 7. Aeration is controlled over the whole measured redox potential and the redox potential is thus kept constant. Min. material required for bio-mass growth is added to the waste water in quantities such that bio-mass losses resulting from dilution are balanced out and the redox potential does not deviate from the constant value. The addn. is controlled in function of redox potential deviation from the theoretical value and of aera intensity.

Degradation rates up to 50% are achieved in over 24 hrs, without flocculation, as opposed to 10-20% by a standard process. The O₂ transfer values are increased to 35 kg O₂/hr, as opposed to 20 kg O₂/hr with a standard aeration device. (7pp)

PICH/ ★ D15 80142 D/44 ★EP --38-235
Treatment of acidic waste water - by conversion to mortar with fly ash and lime based binder

PICHAT P 09.04.80-FR-007917

L02 (21.10.81) C02f-11 C04b-31

25.03.81 as 400468 (367NS) (F) FR2146700 FR2320266 US4116705 US4149968 FR2278648 FR2286116 US2815293 E(BE CH DE GB IT LI NL SE)

Treatment of highly acidic waste water (pH not more than 2) to obtain a solid material which is stable, non-polluting and resistant to leaching by water is carried out by mixing the waste water with fly ash to form a paste, neutralising the paste, and adding a lime-based binder to produce a mortar-like material, which is pref. transported to its ultimate destination before setting. The fly ash is pref. used in an amt. of 30-260 pts.wt. per 100 pts.wt. of waste water. The waste water is pref. mixed with the fly ash at 0-100 deg.C under agitation and then neutralised by adding CaCO₃ (e.g. as crushed chalk or limestone) to pH 4 and then adding lime (as quicklime or slaked lime) to pH 7.

The mortar can be used as a building material. Due to activation of the fly ash by the acid in the waste water, it sets to a hard mass with high compressive strength and good resistance to leaching of metal cations. (16pp)

CTBC- ★ D15 80208 D/44 ★FR 2478-863
Absorbent cpd. e.g. for hydrocarbon(s) - comprises epoxy foam powder with outer open cell and inner closed cell particles with floating properties in water

CTB CHAUDRON TUYAUT 20.03.80-FR-006548

A87 H03 J01 (25.09.81) C09k-03/32

20.03.80 as 006548 (950AS)

Absorbent cpd. comprises a ground epoxy foam powder in which each particle contains peripheral, wettable, open cells and internal closed cells imparting good floating properties to the particle. Specifically the powder is Mepoxab (RTM). Its properties are high absorption power (2.1/2 times its vol.); it can absorb all hydrocarbons; it does not absorb water; it will float even when saturated with hydrocarbons.

Used for removing oil slick from the surface of water and recovering hydrocarbons, paints, solvents, acidic or basic chemicals, fats and domestic or industrial pollutants from water. (9pp)

Membrane sepn. appts. for reverse osmosis processes, esp. for water desalination and purification, incorporates a double-acting pump which the piston divides into a pumping chamber for feed liquid and an expansion chamber for liquid rejected by the membrane.

The piston rod has different dia. in the two chambers, for pressure equalisation purposes by vol. differences as between the lighter feed liquid and denser reject liquid so that pressures required to operate the valves simultaneously are equal. Low energy input is needed, esp. for manual or wind-powered domestic appts. (14pp)

EAUC- * D15 80286 D/44 *GB 2074-037
Filter bed for liq. - has layers of coarse and fine particulate material with screens and distributor plate for enhancing even flow distribution

L'EAU CLAIRE SYSTEM 03.04.80-US-137479

(28.10.81) B01d-29/08

17.11.80 as 036866 (67AT)

The filter bed comprises a series of layers of particulate material, at least one layer consisting of fine particulate material which becomes fluidised during purging and at least one layer consisting of material too coarse to be fluidised during purging and positioned beneath the layer of fine material. Between adjacent layers of coarse and fine material is a lower screen having openings which are too small to allow passage of the coarse material.

An upper screen located on top of the layer of fine material has openings large enough to allow passage of the fine material when fluidised but small enough to prevent breakup of the fine material layer when unfluidised. The coarse material layer is supported by a perforated distributor plate having nozzles through which a liq. to be filtered and a purging fluid are introduced.

The screens and distributor plate enhance even flow distribution through the filter. (10pp)

 19.03.75 as 033446 (NS)
 In the treating of smoke-washed waste water for incinerating industrial wastes contg. a heavy metal and a reductive matter and a waste water resulted from a waste gas desulphurising appts., the improvement comprises adding a mineral acid (e.g. H2SO4) or an alkali agent (e.g. Ca(OH)2) to adjust its pH to 3-4 and oxidising it with a NaClO2 while maintaining its temp. at about 50 deg.C, adjusting the water thus treated at a pH of 9-10 by use of an alkali agent followed by cohesion pptn., subjecting a supernatant liquor to a filtration treatment followed by contacting with an activated charcoal.

It is possible to remove simultaneously the heavy metal and the reductive matter (C.O.D.) and its C.O.D. is lowered to less than 10 ppm. (J51109149) (3pp)

SUMO D15 36840 Y/21 = J8 1042-360
Regenerating ion-exchange resins after activated sludge treatment - using sodium chloride soln. which is treated and then recycled

SUMITOMO CHEMICAL KK 21.01.74-JP-009451
 (03.10.81) *J50103-164 + C02f-01/42 C02f-09
 21.01.74 as 009451 (38TM)
 Effluent from activated sludge processing is treated with a strongly acidic cation-exchange resin to remove NH4+ -N. Spent resin is regenerated with a NaCl soln., and the effluent contg. 60-95% NaCl is collected. The pH is adjusted and hardness is removed by pptn., and filtration NH4+ in the filtrate is removed by ammonia-stripping; the treated soln. is neutralised and its NaCl concn. is adjusted to reuse it for resin regeneration.

Thus 2 columns (A and B) contg. 13.5 l each of strongly acidic exchange resin (degree of cross linkage 12%) were prepd. The 2 columns were successively regenerated with 10% NaCl and tap water at 21/l of resin, resp., followed by washing with effluent from the activated sludge process. This was repeated 8 times, using regenerated NaCl soln. from the previous cycle for column A and for column B freshly prepd. NaCl soln.

The recovered NaCl regeneration soln. was adjusted to pH 11.0-12.2 with NaOH to ppte. hardness as hydroxides and filtered. The filtrate was ammonia-stripped. The treated soln. was neutralised with HCl, its NaCl concn. was adjusted to 27-31% and used for resin regeneration in the next cycle. (J50103164) (7pp)

 03.02.75 as 014197 (+ 16.3.74-DE-412828) (TM)
 An electrode is mfd. by fusing a mixt. of Ti and TiO powders to give a base material of TiOx where x is between 0.25 and 1.5. This fused mixt. is porous and so fairly light and is coated with a layer of titanium powder fused again to give good adherence, then finally coated over at least 5% of its surface with a noble metal, e.g. platinum.

The pores of the base material act as gas evacuation passages. To keep the bottom of the electrode free of gas bubbles, inclined channels are formed which allow the gas flow to the surface of the cell.

The electrode can be used in e.g. mercury or diaphragm cells for prodn. of chlorine; for the oxidn. or org. prods. and for cathodic protection. The electrode is not consumed during the electrolysis but offers little electrical resistance. Helps prevents build up of gas bubbles on the surface which affect efficiency and the rough surface allows greater current density to be used (J50109176) (8pp)

Poultry manure suspended in water is aerobically fermented - to remove organic matter then carbonate and fed to algae culture for feedstuff

UNIE VAN KUNSTMESTF 28.02.80-NL-001214

C03 (D13) (01.10.81) A23k-01 C02f-03/32

28.02.80 as 001214 (1190AT)

The arrangement is intended for treating e.g. poultry manure in suspension in water, feeding the suspension to an algae culture, dissolving carbon dioxide obtd. by combustion, growing algae in the culture exposed to light, and sepg. the algae thus produced for mixing with animal feed.

The manure is mixed with the water and the organic matter present in the suspension subjected to aerobic fermentation to produce carbon dioxide and a protein-rich sludge contg. micro-organisms. After sepg. this sludge, the remaining soln. contains mainly inorganic matter and is fed to the culture for growing the algae.

Aerobic fermentation prior to algae culture removes the organic matter which would otherwise promote bacterial growth interfering with prodn. of algae. It also produces part of the carbon dioxide which is mixed with the organics-free soln. to make algae growth possible. The fermented organic sludge forms a further valuable component for mixing with the feedstuff. This arrangement eliminates the need for drying the manure and the resulting unpleasant smell, requires less energy and provides a more useful prodn. (11pp)

Obtaining pure sodium chloride from holding pond - by washing contaminated salt in high efficiency solids washing column

DOW CHEMICAL CO 20.09.81-RD-210014

E34 (10.10.81) C01d-00/*

20.09.81 as ----- (AT)

Holding ponds are commonly used to store aq. brine contaminated with other materials which are produced as by-prods. in chemical processes. These ponds accumulate large quantities of pptd. sodium chloride salt contg. organic and other contaminants. This salt reduces the capacity of the holding pond and must be removed.

Opt. the contaminated salt is washed with water in a high efficiency solids washing column to remove water-soluble organic materials from the salt surface without dissolving much salt. The lightly contaminated salt is dissolved in water to produce a conc. brine soln. The aq. brine soln. is then sepd. from any insoluble material present. The vol. of the aq. brine soln. is reduced by evapn. to recrystallise pure salt. Solar heat or process waste heat can be economically used to promote evapn. The aq. brine should not be so conc. that soluble organic materials co-precipitate with the salt. The recrystallised salt can be readily recovered and washed again to achieve the desired purity.

Either or both the first and last washing steps can be dispensed with if the salt is not too contaminated. Water contg. the soluble organic materials can be returned to the holding pond or sent to digester units which use biological organisms to break down the organic materials. (-pp)

20.09.81 as ----- (513AT)

Photographic effluents contg. e.g. 0.1-0.3% Ag in the form of soluble ligand complexed Ag, are treated to recover the Ag by adding sodium sulphide to form a colloidal silver ppt, and conc. the liquor by ultrafiltration.

Ultrafiltration is pref. carried out using a tubular ultrafiltration system and gives a concentrate with a silver sulphide solids concn. of up to 40%, and a permeate in which the Ag and Cd levels are acceptable for draining off. Pref. the pH is

maintained below 7 during ultrafiltration by addn. of small amts. of Na₂S₂O₄, which inhibits air oxidn. processes and ammonia formation during ultrafiltration, which can lead to formation of soluble Ag complexes which pass into the permeate.

In an example a feed soln. contg. 0.21% Ag was subjected to ultrafiltration through a WFA 500 membrane to give a 50% vol. redn. The permeate had a concn. of Ag of 0.07 mg/l, Cd 0.085 mg/l and a pH of 6.8. (1pp)

Bacteriological decomposition plant for fluid producing methane gas - using pump unit and valve body in movement of untreated fluid to process chamber and treated liquid from it

BOSTROM O 07.03.80-SE-001794

E17 (12.10.81) B01j-04 C02f-11/04

07.03.80 as 001794 (1161WB)

Plant for recovery of methane gas from a fluid by breaking down its constituents bacteriologically, has at least one process chamber, a first container for untreated fluid, a second container for treated fluid, a pump unit transferring untreated liq. from the first container to the process chamber and from the latter to the second container, and a heat exchanger transferring heat from the treated fluid to the untreated material during transfer.

The pump has at least two work chambers, and pressure components to vary the chamber volumes. The one chamber, on filling or emptying of the process chamber, receives untreated fluid from the first container and then transfers it to the process chamber. The second chamber takes treated fluid from the process chamber and passes it to the second container. A valve body alternately connects the pump work chambers with the treatment chamber and one of the containers.

Heavy metal removal from waste solns. - using appts. which includes pH sensing probes for correct acidification and alkalinisation of soln.

DURKEE R G 24.01.80-US-115039
J01 M11 V04 (13.10.81) C22b-15/12

24.01.80 as 115039 (994DH)
The appts. comprises a reaction chamber and a source of conc. acid at a pH of less than 2. Acid enters the reaction chamber by means of a valve, the amt. being controlled so that the soln. pH is maintained at a set level. Al is kept stable in the soln. to form a salt with the acid anions so that heavy metal salts are pptd., by positioning retaining barriers at set points in the chamber.

The appts. is also claimed for removing Cu salts from waste solns., and also has an acidification chamber into which conc. H₂SO₄ is pumped through a valve. Pure Cu ppte. is collected from the soln. An alkalisation chamber is connected to the reaction chamber and by another valve, to a source of alkali to neutralise the treated soln. for disposal.

The appts. is partic. for removal of Cu from etch, solder and plating rinses obtd. in printed circuit board mfr. The formation of white fluff and slime in the spent soln. is avoided, so pollution is reduced less expensively. (8pp)

DOWC ★ D15 81511 D/44 ★ US 4294-589
Removing trapped gas under pond liners - by floating liner on liq. and venting gas up sides of pond

DOW CHEMICAL CO 22.12.77-US-863633
(13.10.81) B01d-53

22.12.77 as 863633 (67)

Trapped gases are removed from beneath a pond liner by partially filling the pond excavation under the liner with a liq. so that the liner floats in the liq. and the trapped gases collect between the surface of the liq. and the liner. The pond is progressively filled on top of the liner with another liq. to force the trapped gases beneath the liner to the sides of the pond. The gases are vented up the sides of the pond to the atmos. and the liq. under the pond line drained away so that the liner settles on the bottom of the pond excavation. A pond used to hold satd. brine for an underground liq. petroleum gas storage installation was relined with chlorinated polyethylene sheeting. Fresh water was pumped through a drainage tile under the pond to float the formed liner and trap air between the water surface and the underside of the liner. Satd. brine was then pumped into the pond to force the liner to the bottom of the pond and cause trapped air to be vented up the sides of the pond to the atmos. The water under the liner is pumped away through the drainage tile.

In plastics lined ponds for storing waste or fresh water. The removal of the trapped gases leaves the liner unrestricted for location and repair of leaks in the liner during use. (3pp)

15.04.81 as 888430 (395RH)

Active therapeutic fractions obtd. from aerobic bacterial strains are new. The active fractions may comprise the washed entire cells, the delipidated entire cells, insoluble particular extracts of the delipidated entire cells or water-soluble extracts of the delipidated entire cells of the aerobic bacteria.

Preferred bacteria are aerobic *Corynebacteria*, esp. *Corynebacterium catarrhalis*, which is a new strain of aerobic

Corynebacterium.

Used as medicaments with adjuvant, immunostimulant, antibacterial and interferon-inducing activity, which may be formulated for intravenous administration or for subcutaneous administration, adsorbed on a mineral gel e.g. calcium phosphate and aluminium hydroxide gels. e.g. 1.365 mg of Al(OH)₃ and 1 mg of active fraction per ml. Activity tests show that aerobic *Corynebacterium* inhibit the growth of Lewis tumours, give 95-100% protection when 5 x LD₅₀ and 80-100% protection when 10 x LD₅₀ doses of E-coli, K-pneumoniae or L. monocytogenes are administered to mice and protect mice against *Listeria monocytogenes* infections. The fractions are used to increase resistance to bacterial and fungal infections in immune-deficient patients, protect patients having certain

malignant tumours against infections and to treat patients undergoing immuno-suppressive treatment such as intensive chemotherapy or radiotherapy. (39pp)

Tricalcium citrate continuous prodn. - by mixing citric acid soln. and calcium salt, reacting in separate stage, then pptn.

BENCKISER J A GMBH 16.04.80-DE-014503

E12 (22.10.81) C07c-59/26

16.04.80 as 014503 (1251BZ)

Continuous prodn of tricalcium citrate (I) comprises reacting a citric acid contg soln with a Ca cpd and then pptn in a separate processing stage. The new feature is that (a) mixing of the reactants and (b) reaction, are separated from each other in both space and time. Pref (a) is carried out in a static mixer, and (b) in a flow-through tube reactor.

Esp. dwell time in the mixer is at most 1 sec, pref below 0.1 sec, and in the reactor at most 20 min, pref below 1 min, with reaction temp 20-50 (30-40)deg C. Pptn is pref in a stirred vessel at 60-90 (65-75)deg C and pH 5.4-6.5, with mean dwell time 0.3-2hr.

Pptn is pref in (a cascade of) stirred vessels, esp two with the first at 40-60 deg C and pH 5.8, and the second at 60-90 deg C and pH 6.5. In a modification both reaction and pptn are carried out in (a cascade of) such vessels.

The method is esp applied to crude fermentation solns and gives a purer prod than known batch processes. The residence time in the reactor is precisely controlled so that premature pptn and development of local regions of alkalinity are avoided. (14pp)

Live organisms are detected by causing them to produce bursts of light when disrupted in the presence of a light producing agent (A), specifically firefly essence. Pref. the test material and (A) are first placed in contact, then the microorganisms disrupted so that they release components (esp. ATP) which react with (A) to produce light. The organisms are pref. disrupted by violent agitation with alumina, ballotini beads, sand or carborundum and light is detected as an electrical pulse from a photon detector. An appts. for this method is also claimed; it comprises a transparent container for sample and (A) (enclosed in a light-tight chamber), device for agitating the sample mixt. either gently or violently and photon detectors.

Very small numbers of bacteria or viruses (e.g. 10 per ml). can be detected in less than 10 sec. Impure reagents and samples (i.e. those contg. ATP), can successfully be examined. (19pp)

A96 B04 S03 (S05) (21.10.81) G01n-33/54

02.04.81 as 301451 (1251NS) (E) DE2733380 GB1503409 US3650437 FR2126760 GB1363565 GB1185065 US3600494 E(AT BE CH DE FR GB IT LI LU NL SE)

Process comprises reacting an appropriate antigen (AG), bonded to a solid support, with a test serum sample, then reacting the resulting solid phase prod. with a labelled anti specific antibody (AB'). The final prod. is labelled by AB' in accordance with the amt. of anti-organism specific antibody (AB) present. The method can be applied to diseases where two antibodies are prod. at different stages of infection there several supported AG are reacted with samples, then one group of resulting solid phases reacted with AB' against the first antibody and the second group with AB' against the second antibody. The ratio of first AB to total AB is then calculated to determine the stage of infection.

The method is esp. applied to the diagnosis of syphilis. Reliable detection of the disease in its early stages is possible. The amt. of both IgM (the first antibody prod. against syphilis) and of total antibody can be measured simultaneously with high sensitivity and accuracy. (12pp)

Plasmid PUC 10 of molecular wt. 6.8 mega-daltons - useful as cloning vector in recombinant DNA research

UPJOHN CO 16.04.80-US-140755

B04 (21.10.81) C12n-15 C12p-19/34

06.04.81 as 301482 (1248KB) (E) No-Citns. E(BE CH DE FR GB IT LI NL SE)

Pure plasmid pUC10 of approx. molecular wt. 6.8 mega-daltons and characterised by single restriction endonuclease sites for the enzymes ECOR1, BclI and XhoI is new.

The plasmid is useful as a cloning vector in DNA research, in which desired genes are incorporated into the plasmid and it is then transformed into a suitable host. It is esp. useful as a vector in Streptomyces organisms, e.g. to increase antibiotics prodn. by such organisms.

Pure pUC10 is obtd. by growth of Streptomyces erythreus, esp. NRRL 2338, on a growth medium until sufficient mycelial growth has occurred. Then the mycelia are fragmented and incubated in a growth medium. After a suitable time the culture is harvested and the resulting mycelia are lysed and pUC10 is isolated from the lysate. The cultivation is at 28-32 deg.C for 36-48 hrs. The fragmented mycelia are incubated in a growth medium, contg. glycine. (11pp)

09.04.81 as 301561 (1248KB) (E) No-Citns. E(AT BE CH DE FR GB IT LI LU NL SE)

Synthesis in a bacterial host, with secretion through the membrane of the host, of a selected protein (I) or polypeptide (II) comprises cleaving a cloning vehicle to form a cleavage site after a promoter of a bacterial gene or phage gene or their DNA fragment. Then forming a hybrid gene by inserting into the cleavage site a non-bacterial DNA fragment that codes for a precursor of (I) or (II); it includes a signal sequence of the selected (I) or (II). A host is transformed with the gene and it expresses the (I) or (II) in mature form.

Cloning vehicle comprising a promoter of a bacterial or phage gene; a translational start signal; a non-bacterial DNA fragment coding for a signal sequence of a non-bacterial (I) or (II); and a non-bacterial DNA fragment coding for (I) or (II) is new. A host transformed with the cloning vehicle is new.

The (I) or (II) is a eucaryotic cell protein, e.g. proinsulin, serum albumin, human growth hormone, parathyroid hormone, interferon etc. From the host the mature (I) or (II) is obtd. directly without the need to remove the signal sequence or other chemical substituents present on the (I) or (II) precursor as synthesised by the bacterial host. The (I) or (II) is recovered from the periplasmic space of the bacterial host cell or from the culture medium. (34pp)

Alcohol and distillers grains prodn. - using dryer operated at elevated pressure with reuse of vapours for process heat

STONE & WEBSTER ENG CORP 17.04.80-US-141256

E17 (28.10.81) B01d-01/26 B01d-03/14

16.04.81 as 112071 (955HM)

In a method for the distn. of a fermented feed to produce alcohols, the feed is distilled in a first column, and sepd. into a first spent stream contg. dissolved organic matter, which is passed to an evapn. zone having at least two regions of successively reduced pressure, and is then distilled in a second column; and a second spent stream contg. insoluble organic matter which is introduced into a drying zone at a pressure below that of the lower region of the first column, to obtain dried distillers grains. A pressurised vapour stream is taken from the drying zone to the first column.

The alcohol is esp. ethanol for use as a fuel. The process has reduced energy requirements, as heat is recovered from recycled 'dirty' process steam. Cooling water requirements are reduced and the need to operate distn. columns at elevated pressure to recover condenser heat is avoided. (6pp)

Sake prepn. free of koji odour - by refining soln. of saccharified rice and adding koji obtd. using *Aspergillus usami*

TAKAGI T 19.02.80-JP-018542

(16.09.81) C12g-03/02

19.02.80 as 018542 (5RH)

Method comprises (a) saccharifying powdery rice enzymically, (b) refining the saccharified soln. using active carbon, anion exchange resin and cation exchange resin, (c) mixing the refined soln. and 'koji' prep. with *Aspergillus usami*, (d) adding 'sake' yeast to the mixt. and (e) fermenting it.

The koji prep. with *A. usami* is free of koji odour and contains large amt. of organic acid such as citric acid, malic acid, etc. For the purpose, *A. usami* IFO4388, etc. may be used. Practically the concn. of the refined saccharified soln. is regulated to be 10-15 and the fermentation is stopped at alcohol concn. 8-12%.

Sake which is free of koji odour and has fruit wine-like aroma, can be prep. easily from inexpensive material such as powdery rice, white bran, etc. (3pp)

JAAT ★ D16 80441 D/44 ★ J5 6117-792
Fixing bio:active substance in polymer matrix - contg. protective substance for bio:active compsn. glutaraldehyde and polymerisable vinyl monomer

JAPAN ATOMIC ENERGY RES 18.02.80-JP-018788

A96 (16.09.81) A61k-09 C08f-02/44 C08f-20/10 C12n-11/08

18.02.80 as 018788 (5AT)

The method is characterised by keeping the compsn. composed of (a) at least one kind of bioactive substances, (b) protective substance (a), (c) glutaraldehyde and (d) polymerisable vinyl monomer at 0-10 deg.C for 1-5 hrs. to polymerise the compsn.

Vinyl monomer is usually used ca. 10 w/w% on the compsn. and in the case of fixing enzyme it is used 20-80 w/w% on the compsn. Glutaraldehyde is used 1-10 w/w% on vinyl monomer. Examples of the vinyl monomer are ethyleneglycol-diacrylate, ethyleneglycol-dimethacrylate, polyethyleneglycol-diacrylate, 2-hydroxyethylacrylate, etc. and examples of protective substance are cow serum albumin, egg albumin, glutamic acid, glycylglycine, glutaric acid, etc.

The word bioactive substance is used to describe compsns. which act physiologically and/or biochemically in living body and examples are enzyme, microbial body, cell, organella, etc. By this method vinyl monomer is polymerised at low temp. using extremely small amt. of glutaraldehyde as the catalyst and bioactive substances can be fixed in the polymer matrix stably with high activity yield. (4pp)

Blood coagulation Factor three extrn. - from Yellow Staphylococcus by multiplying and extrn.

YOSHIDA K 04.07.75-JP-083224
B04 (03.10.81) *J52007-416 A61k-35/74 + C07g-17 C12p-01/04 C12r-01/*

04.07.75 as 083224 (140KB)

Yellow Staphylococcus is multiplied at a pH 7.2-9.5 and polysaccharides are then extracted from the surface layer of the microbial cells and the culture supernatant at this pH range.

In an example, Yellow Staphylococcus was cultivated in a culture (0.3 M tris-HCl buffer soln, pH 8.4 and brain heart infusion culture dialysis external liquid) and centrifuged for 20 minutes. The supernatant was concentrated, and the ppte. was floated in a 0.03 M tris-HCl buffer soln., ultrasonically oscillated and centrifuged DNase and RNase were acted on the combined supernatant in a warm bath. Chloroform was added followed by shaking and centrifuging to separate into 3 layers.

Chloroform was added to the upper layer and the same procedure as above was repeated until the white ppte. in the middle layer disappears, thereby removing the protein. The upper layer was subjected to dialysis with a 0.03 M tris-HCl buffer soln. (pH 8.4). To the content were added 3/1000 vol. of satd. sodium acetate and then 5 times vol. of ethanol followed by stirring. The mixt. was stood for 24 hrs. The white ppte was collected by centrifuging, and acetone added, and the above procedures after the addn. of acetone were repeated followed by centrifuging. The ppte. was dried to obtain the desired substance. (J52007416) (3pp)

Prodn. of N: acetyl-S: alkylmercaptocysteine - used in prodn. of optically active S: alkylmercapto-cysteine with an acylase

AJINOMOTO KK 13.06.75-JP-071687

E16 (06.10.81) *J51149-224 C07c-148 C07c-149/24

13.06.75 as 071687 (16AS)

O-Alkylserine or O-alkyl-N-acetylserine is reacted with an equimolar amt. of thio-acid in the presence of a two-molar amt. of acetic anhydride. The resulting 2-alkyl-4- (5-acylmercaptomethyl)-5-oxazolone is hydrolysed with an acid or a base. Basic hydrolysis gives N-acetyl-cysteine which is then treated with a combination of a dialkyldisulphide with H₂O₂ to obtain N-acetyl-S-alkyl-mercaptocysteine. For basic hydrolysis, any base other than ammonia may be used, e.g., NaOH or K₂CO₃ is used conveniently. Alternatively, acidic hydrolysis gives cysteine. In this case, the cysteine is converted into S-

alkylmercaptocysteine and subsequently, the latter is subjected to N-acetylation.

The prod. is synthesised by a simple and convenient process. The prod. is an excellent substrate for the enzymatic optical resolution, because it does not inhibit the enzymes used such as acylase. (J51149224) (4pp)

26.10.76 as 129106 (200DH)

Coenzyme Q is prepd. by aerobically cultivating a yeast having a max. specific growth rate of at least 0.15 hours⁻¹ under optimum growth conditions, in a nutrient medium allowing the yeasts to grow. The concn. of the dissolved O₂ in culture liquor is kept at at least 2 ppm. The average specific growth rate during the whole cultivation period is controlled at max. 0.1 hr⁻¹. The coenzyme Q is then separated from the yeast cells obtd. by standard processes, e.g. by yeast cell saponification and solvent

Prod. is esp. the coenzyme Q6-10 homologue. Coenzyme Q is a quinone deriv. playing an important part in terminal electron system of organisms. The structure of coenzyme Q is that of 2,8-dimethoxy-5-Me-1,4-benzoquinone with an isoprenoid side chain in the 6-position.

Yeast cells contg. large quantities of coenzyme Q are obtd. in high concns. under high dissolved O₂ conditions. (J53052690) (7pp)

The beta-glucanase is e.g. beta-1,3- and/or beta-1,6- glucanase, pref. endo type ones. Extn. of glutathione is effected with hot water or mineral or organic acid, or a mixt. of organic solvent and acid. Treatment with beta-glucanase is effected for a short period at 10-50 deg.C at pH of 3-7, pref. followed by irradiation with ultrasonic wave, so as to destroy the glucan layer of cell walls.

The process extracts glutathione at a yield twice as large as the conventional extrn. processes. (J53052688) (4pp)

UPJO D16 33075 Y/19 = J8 1042-919
(9)-Alpha-hydroxy-androstenedion fermentation prodn. - from
(17)-alkyl-steroids e.g. sitosterol using new Mycobacterium
fortuitum mutant (NL 26.4.77)

UPJOHN CO 24.10.75-US-625653
B01 (07.10.81) *DE2647-895 C12p-33/06 C12r-01/32
23.10.76 as 126825 (280JB)

In the prodn. of 9alpha-hydroxyandrostenedione (I), *Mycobacterium fortuitum* NRRL B-8119 is cultivated under aerobic conditions in an aq. nutrient medium in the presence of a steroid with 2-10 C in the 17-alkyl side-chain. Pref. steroids are sitosterol, cholesterol, stigmasterol and campesterol. *Mycobacterium fortuitum* NRRL B-8119 is claimed per se as a new laboratory mutant.

In an alternative new process for the prodn. of (I), a microorganism capable of selective degradation of steroids with a 2-18C 17-alkyl side-chain and of forming or accumulating (I) in the fermentation broth, selected from *Arthrobacter*, *Bacillus*, *Brevibacterium*, *Corynebacterium*, *Microbacterium*, *Nocardia*, *Protaminobacter*, *Serratia* and *Streptomyces*, is cultivated under aerobic conditions in an aq. nutrient medium in the presence of a steroid with a 2-10C 17-alkyl side-chain.

9alpha-hydroxy cpds. of the androstane series are useful as antiandrogens, antiestrogens and antifertility agents. They are also useful as intermediates for other steroids, e.g. 9(11)-dehydro cpds. which can be converted into 9alpha-halo-11beta-hydroxy cpds.

An example in the specification describes the prodn. of *Mycobacterium fortuitum* NRRL B-8110 by mutation of *M. fortuitum* ATCC 6842, and the conversion of sitosterol into (I) by the mutant. (J52054093) (7pp)

In a first stage (i) aq. slurry of the comminuted material is formed and then (ii) a starch rich fraction is sepd. from the greater part of the other components of the slurry. Then (iii) the starch fraction is washed in at least one stage to give a slurry of required purity, fresh water being introduced at step (iii) and reused in steps (i) and (ii). The improvement comprises sepg. a stream of process water into first and second fractions, of which the first has a lower content of both soluble and insoluble matter and is recycled for use with fresh water in step (iii).

The modification is esp. useful in the sepn. of corn starch and protein. It enables the starch washing steps to be carried out at higher dilution to give a purer prod without increasing the amt. of water used, which eventually has to be disposed of as light steep water. Alternatively, the use of water can be reduced, and a smaller quantity of more conc. steep water produced, without redn. in the purity of the starch produced. (30pp)

NOVO★ **D17** **80325 D/44 ★GB 2074-167**
Saccharification of starch hydrolysates - to high dextrose contg. glucose syrups using combination of glucoamylase and isoamylase

NOVO INDUSTRIAL A/S 11.03.80-US-129314

(D16) (28.10.81) C12p-19

09.03.81 as 107287 (955AT)

A starch hydrolysate is hydrolysed to a high dextrose equiv. glucose syrup by treatment at a pH of 3-5 with a combination of glucoamylase and isoamylase.

The substrate is typically a starch hydrolysate soln. of DE 8-12 and solids content 20-50%, esp. 30% saccharification is carried out at 50-60 deg.C, using 0.05-0.3 AG units glucoamylase per g. dry substance, esp. 0.075-0.15 AG units per g. and 25-500, esp. 100-200 /IA units per g. dry substance, of isoamylase.

A higher degree of conversion can be achieved with reduced levels of enzyme, as the optimum pH values for max. activity of the enzymes match, and therefore this pH can be used. (10pp)

GREAS★ **D17** **80339 D/44 ★GB 2074-187**
Extn. of sugar from plant tissue esp. beet - with addn. of carbon dioxide to diffusion water flow near juice end of appts.

GREAT WESTERN SUGAR 14.10.80-US-196548 (22.04.80-US-142664)

(28.10.81) C13d-01/02

21.04.81 as 112382 (955JB)

In the extn. of sugar from plant tissue, the plant tissue is contacted near the juice end of the process with diffusion water contg. carbon dioxide. The process is esp. applicable to sugar extn. from sugar beet cossettes. The CO₂ may be dispersed in the diffusion water from nozzles in the bottom of the appts. near the juice end. It can also be added in the form of a carbonate or bicarbonate salt, or as solid CO₂. Typically at least 0.5, esp. 0.625 kg CO₂ are used per metric ton of beet processed.

The efficiency of sugar extn. and the purity of the juice obtd. are increased. (12pp)

MITD★ **D17** **80443 D/44 ★J5 6117-798**
Sugar compsn. mfr. - by enzymic converting sucrose to paratinose and controlling fructose and glucose by regulating temp.

MITSUMI SEITO KK 20.02.80-JP-019103

(D16) (16.09.81) C12p-19/12

20.02.80 as 019103 (5KB)

Sucrose is converted to paratinose with the enzyme produced by bacteria method comprises controlling the content of by-produced glucose and fructose through regulating the converting temp. and solidifying whole compsn. The converted soln. is then refined using strongly acidic cation exchange resin and weakly basic anion exchange resin in combination and the refined soln. is solidified by spray-drying method, solidifying and crushing method, vacuum-drying method, foam-drying method, etc.

By the enzymic conversion, 70-92% of sucrose is converted to paratinose and 2-20% of by-produced glucose and fructose are contained in the converted soln. The content of glucose and fructose is increased with elevation of the converting temp. and by regulating the converting temp. the converted soln. having prescribed glucose and fructose content are obtd. (7pp)

AJIN **D17** **91056 Y/51 = J8 1042-275**
Prepn. of material for use in citric acid fermentation - by forming glucose and fructose from semi finished prod. of sugar mfr., sepg. part of fructose and neutralising remaining soln.

AJINOMOTO KK 30.04.76-JP-049462

E13 (D16 E17) (03.10.81) *J52134-077 + C12p-07/48 C12r-01/72

30.04.76 as 049462 (5NS)

Method comprises hydrolysing the half-finished prod. of sugar factory (e.g. raw cane juice, raw sugar, cane molasses, beet molasses or refinery molasses) to form glucose and fructose, sepg. the formed fructose partly by adding calcium to the hydrolysate; neutralising the remaining soln. with gaseous carbon dioxide and using the neutralising prod. directly as the material for citric acid fermentation using yeast of *Candida*.

Pref. sugar juice is hydrolysed with an acid or enzyme e.g. with hydrochloric acid at pH 1.5-2 at 60-100 deg.C for 0.5-4 hrs. The hydrolysate is neutralised with alkali. Quick lime or slaked is then added to the hydrolysate to separate calcium adduct of fructose partly (30-90% esp. 50-65%) by crystallising it once or twice. The sepd. adduct is, after washing with water, neutralised with acid to isolate fructose. The remaining soln. after sepn. of fructose, is neutralised with gaseous carbon dioxide. The obtd. liq. contains CaCO₃ and can be used as the material for citric acid fermentation from a yeast of *Candida* e.g. *C. citroformans* AJ14473 (FERM-P 3072) and its variety *C. citroformans* AJ 14500

(FERM-P 3397).

The sugar purity of the material is decreased by recovering fructose, but the fermentation yield is increased. Sugars in the material can be better utilised and the load for treating waste water is not increased. Citric acid and fructose are prepd. inexpensively. (J52134077) (4pp)

VELT/ D17 72159 D/40 = US 4294-824
Prepn. of particulate carbohydrate(s) from soln. - by granulation with solid prod, then drying with dielectric heating

Tubular transverse circulation filter tip for cigarette etc. - is now mass produced to compete with axial flow filter tip
BRIT AMER TOBACCO LTD 18.06.80-GB-019887
A97 J01 P15 (16.10.81) A24d
17.06.81 as 889265 (448BZ)

A cigarette filter tip of the tubular, transverse circulation type. Also a method and an installation for the mfr. of the tip. The tip is of the type comprising a central, tubular filter diaphragm with an outer layer of fibrous packing material permeable to smoke. The fibrous layer is externally sleeved with a film of material impermeable to the smoke. One end of the tip is formed by sealing a transverse barrier across the fibrous layer. At that cross-section smoke can only flow through the central passage of the tubular diaphragm. The other end of the tip is formed by closing together and sealing the wall of the tubular diaphragm. At this second end smoke can only progress axially via the fibrous layer.

The tubular filter diaphragm is pref. made of thermoplast fibres partic. cellulose acetate, polypropylene or regenerated cellulose. The packing layer fibres are pref. also of thermoplastic material, partic. cellulose acetate. Heat sealing is pref. employed to render selected cross sectional areas impermeable to smoke.

Used for mass prodn. of filter tips for cigarettes etc. The tubular transverse circulation filter tips are more efficient than axial flow tips for a given pressure drop in the inhaled smoke. The new tip is simple and cheap to mfr. (20pp)

02.05.80 as 145985 Div.ex 4241097 (513AS)

The aroma or taste of smoking tobacco is augmented or enhanced by incorporating a cpd. (I) in which Z is a benzo or cyclohexano gp. The (hexahydro) 1,4-benzodioxan-2-ones impart a sweet, spicy, vanilla-like, woody, hay, tobacco-like aroma prior to smoking and a sweet, spicy, hay tobacco-like aroma on smoking. They may be incorporated into the tobacco or into filters or wrappers in contact with the tobacco.

(I) are prepd. by reacting (II) with (III) in the presence of B, in which X is Cl or Br; Y is Cl, Br or OR; R is 1-3C alkyl; B is MOH, MH, MOR', trialkylamine or M₂CO₃ in which M is alkali metal, esp. Na or K; and R' is lower alkyl, with the proviso that B is trialkylamine or alkali metal carbonate if Y=Cl or Br and B=MOH, MH or MOR' if Y is OR. Parent specification US4241097 (01859 D/02) relates to use of (I) an organoleptic agent in foodstuffs. (16pp)

B05 E17 + P83 (21.10.81) A61k-47 B01j-21/02 B01j-23/02 B01j-29/06 C07c-148 C07c-149/18
21.02.81 as 101252 (1401BZ) (G) CH-574408 DE2129162 DE2209458 DE1801551 E(BE CH DE FR GB IT LI NL)

The prepn. of 3-mercapto-propane-1,2-diol (I) comprises reacting

liq. H₂S with glycidate at a pressure such that H₂S remains in liq. form. Reaction is catalysed either in heterogeneous phase at 30-150 deg.C using a solid catalyst or in homogeneous phase at 30-180 deg.C using a catalyst which dissolves in the reaction medium.

The molar ratio liq. H₂S to glycidate is pref. 3:1-10:1 (esp. 4:1-6:1). Pressure is pref. 15-200 bar. The heterogeneous catalyst is pref. an aluminium oxide (esp. an activated aluminium oxide with alkali content 0.02-5 wt.%) or a sodium aluminium silicate (esp. a zeolite or hydroxysodalite). The homogenous catalyst is pref. an alkali hydroxide or an alkaline earth hydroxide. Reaction is pref. carried out in a small amt. of a solvent such as water or a lower aliphatic alcohol.

(I) is an important inter, and can be used in the synthesis of hair cosmetics, depilatory agents, protecting agents against UV and X-rays, stabilisers for pharmaceutical formulations, photographic developer solutions, colour stabilisers for polymers, enzyme activators in enzyme-contg. detergents.

(I) is obtd. in high yields using a technically simple method. When a homogenous catalyst is used, the presence of the dissolved catalyst in the crude product does not interfere with distillative work up and has no effect on the final yield. The use of the homogeneous catalyst is esp. useful for discontinuous processes in autoclaves or stirring appts. (14pp)

High strength dental cement - contains resin and synthetic fibres of polyester, polyamide, etc. or granules of graphite, glass etc. for high mouldability

INOUE JAPAX RES INC 25.02.80-JP-021578

A96 (16.09.81) A61k-06/08

25.02.80 as 021578 (42RP)

A dental cement (I) is composed of a usual dental resin (II) and a fibre, fine piece or fine granule of a suitable material (III). (III) is selected so that the mechanical strength of the mixt. of (II) and (III) is a prescribed value.

Ester resins, acryl resins, methacryl resins, and epoxy resins are used as (II). Examples of (III) are synthetic fibres of polyester, polyamide, polyolefin, acrylate etc., and glass, carbon, graphite, alloys, etc. Before the mixing (II) with (III), (III) should be treated by electric discharge in an inactive gas under a reduced pressure.

(I) has high mechanical strength, high compressive strength, and high transparency. (I) is easily moulded in a desired shape. (3pp)

SEIW ★ D21 80455 D/44 ★ J5 6118-011
Hair setting compsn. - contains water, alcohol and water soluble keratin hydrolysate

SEIWA KASEI KK 22.02.80-JP-021158

A96 (16.09.81) A61k-07/06

22.02.80 as 021158 (42PW)

Hair-setting cosmetic (I) contains water, alcohol and water-soluble keratin-hydrolysate having 2 or more mercapto gps., which is prepd. by redn. of keratin with mercaptan or sulphide in alkaline pH followed by enzymic hydrolysis. Compsn. holds its hair-setting effect for a long period.

The reduction of keratin cleaves the disulphide-linkage generating mercapto gp. at the cleaved position. Enzymic hydrolysis depolymerises the reduced keratin by cleavage of the peptide-linkages. The hydrolysate is prepd. by adjusting the degree of the hydrolysis. When the compsn. is sprayed on hair, the hydrysate forms a layer coating hair, polymerising with disulphide-linkages caused by oxidn. with oxygen in air. Since amino and carboxyl in the hydrolysate strongly bind with those in hair, the layer of hydrolysed is hardly removed by being washed. The hydrolysate is produced from keratin of wool, hair, nail, etc. with use of mercaptan such as thioglycol, cystein, thioglycerol, etc. and sulphide such as sodium sulphide, or potassium sulphide. (5pp)

LIOY ★ D21 80456 D/44 ★ J5 6118-012
Oral compsn e.g. tooth-paste, mouth-wash etc. - contg. dextranase to inhibit oral tartar prodn. and, as stabiliser, a fatty acid ester of a sugar alcohol

LION CORP(LIOC) 23.02.80-JP-022071

(D16) (16.09.81) A61k-07/28

23.02.80 as 022071 (42RH)

Compsn. (I) contg. dextranase (II) with fatty acid ester (III) of sugar alcohol (IV) selected from lactitol, maltitol, malto-tritol, malto-tetra-itol, malto-penta-itol, malto-hexa-itol and malto-hepta-itol is new.

In order to prevent formation of tartar, a cause of dental caries, (II) is added in an orally administered composition. But (II) is easily decomposed by the actions of water and anionic cpds. in the compsn., losing its activity. Addn. of (III) stabilises (II). (I) is used as dentifrice, tooth paste, tooth powder, mouth wash, gargle, troche, etc.

(III) is non-toxic and has high foaming effect. (III) has no bitter-taste, and has features in high resistances against heat, acid and alkali. (IV) is produced by electrolytic redn. or catalytic redn. of the corresp. sugar. The fatty acid reacted with (IV) for prodn. (III) should have 8-20C, e.g. (10-18C), satd. acyl or 16-18C unsatd. acyl. The degree of esterification of (III) should be 0.5-3.0, e.g. (0.8-2.0). (6pp)

TAIY ★ D21 80654 D/44 ★ J5 6118-720
Emulsifier for water-in-oil emulsion - contg. liq. or pasty fatty acid ester of trihydric alcohol, pectin and/or hydroxypropyl guar gum and e.g. poly:ol

Aq. skin-treating compns. - contg. lower alcohol and organic acid

JOHNSON & JOHNSON 21.08.75-US-607171 (01.11.73-US-411939)

B05 (13.10.81) A61k-31/19

21.08.75 as 607171 (367BZ)

Skin-treating compsns. comprise (a) 85-100 wt.% of an aq. phase contg. an alcohol (I) and an organic acid (II), and (b) 0-15 wt.% of a lipid phase. Specifically, (I) is n-propanol or a 4-6C monohydric aliphatic alcohol and is present in an amt. of 0.1-35 wt.% and (II) is a 2-10C aliphatic mono-, di- or tri-carboxylic acid opt. alpha- and/or beta-substd. by OH or keto and is present in an ant. sufficient to give a pH of 2-6.5.

The compsns. pref. contain 0-5 wt.% lipid phase, which can be wool fat, paraffin oil or petroleum. (I) is pref. n-butanol, n-pentanol or n-hexanol, present in an ant. of 0.1-5 wt.%. (II) is pref. propionic, valeric, caproic, oxalic, malonic, succinic, adipic, pimelic, maleic, lactic, alpha- or beta-hydroxybutyric, pyruvic, acetoacetic, glyceric, glycolic, citric, or tartaric acid, present in an amt. of 0.1-5 wt.%.

Suitable topical medicaments include retinoic acid, antinflammatory agents, antifungal agents, antimitotics, quat. ammonium cpds., carbonilides, saligylanilides, hydroxydiphenyls, organometallic or halogen antiseptics, urea, antibiotics etc.

The compsns. can be used as an emollient for dry or flaky skin or as a vehicle for topical medicaments. (5pp)

DESP ★ D21 81611 D/44 ★ US 4294-855
Emollient bath beads contg. urea - giving neutral soln. which is non irritating to skin

DESOTO INC 26.11.75-US-635282

E16 (13.10.81) A61k-07/50

26.11.75 as 635282 (955HM)

Bath beads comprise at least 50 wt.% of prilled urea, contg. 0.5-10 wt.% absorbed oily emollient, and being dried with a water soluble dye.

Suitable emollients include monoglycerides, fatty acid esters, mineral oil, higher alcohols or ethoxylated lanolin alcohols. It can be incorporated before or after prilling. The compsn. may contain anticaking agents, e.g. modified proteins, starches or gums, and opt. 0.1-3% germicide, and about 2-15% of surfactant esp. an alpha olefin sulphionate, which can give foaming effects if desired.

The urea provides good emollient effects and enhances the bead-like appearance of the prod. It is non-toxic and non irritating. The compsn. is unaffected by hard water. (3pp)

Plastic lens unit for intra-ocular implantation - esp. in rear chamber of eye, is positively located from ciliary channel

TENNANT J L 19.09.80-US-188819

A96 P32 P81 (13.10.81) A61f G02c

13.04.81 as 888392 (448)

Plastic lens unit for intraocular implantation by locating and fixing in a circular chamber in the eye of a patient comprises a lens having an integral radial arm with an outer end symmetrical segment having an outer edge radiused from a centre on the axis of the arm. Extending from the lens, is an elastically flexible finger. The outer end of the finger is curved in an arc concave towards the lens and centred on the axis of the opposed arm.

Pref. the plane of implanted contact of the edge of the arm segment and the outer end of the finger lies in front of the lens surface when the lens unit is for implantation in the rear chamber of the eye. This keeps the lens clear of the iris. Pref. the lens, arm, segment and flexible finger are all made of the same material. Alternatively, the lens, arm and segments can be made of comparatively rigid material like polymethyl methacrylate while a more flexible material, such as polypropylene is used for the finger.

Lens to be implanted as treatment for cataract etc. The unit can be conveniently introduced through the pupil. It is easy to centralise the lens and to fix the unit so that it cannot be accidentally displaced. Loading is evenly distributed over the edge of the arm segment and curved finger end, so that stresses on cell tissue are minimised. (19pp)

14.04.80 as 014194 (280AT)

New timber preservatives contain an aq. soln. of 2,5-dimethyl-furan-3-carboxylic acid N-methoxy-N-cyclohexyl-amide (I) and an alkyd resin.

The alkyd resin is pref. a neutralised alkyd resin. The new agents pref. contain an insecticide (esp. gamma-hexachlorocyclohexane), an additional fungicide (esp. tributyl-tin derivs), and an alkylene oxide addn. prod. of an alkylphenol (esp. the addn. prod. of nonylphenol with 8-11 mol ethylene oxide).

(I), which is normally water-insoluble dissolves in water in the presence of alkyd resins without losing its fungicidal activity, so that the solns. are effective timber preservatives. (9pp)

STEI ★ D22 79958 D/44 ★DE 3015-220
Odorous substance removal from effluent air - e.g. in food industries by scrubbing with water contg. nonionic and or ampholytic cpds.

STEINECKER A MASCH GMBH 19.04.80-DE-015220
E19 P34 (22.10.81) A611-09/14
19.04.80 as 015220 (200DH)

Odorous substances are removed from the outgoing air of brewery- and malting-, coffee roasting-, fish processing- and soup flavouring plant and from works for disposing of animal bodies, etc., by scrubbing with sprayed-in washing water contg pref 0.1-3 (0.5-1.2) wt % added (A) nonionic cpds and/or (B) ampholytic cpds.

The nonionic cpds (A) can be (A1) partial esters of polyalcohols, e.g. glycerol mono- or di-stearate and -oleate, sorbitol monostearate and -oleate, or (A2)ethylene oxide- or propylene oxide adducts with fatty acids, fatty alcohols, fatty amines, partial fatty acid esters of polyhydric alcohols, esp of glycerol and sorbitol, alkylphenols, water, ie. polyalkylene glycols. The ampholytic cpds (B) can be (B1) long-chained substd aminoacids, e.g. N-alkyl-di-(aminoethyl)-glycine, N-alkyl-2-aminopropionate or (B2)betaines, et. (3-acylaminoethyl)- dimethyl-glycine and alkyl-imidazolium-betaines.

The process is non-polluting. (A) and (B) can be decomposed biologically and can be discharged with waste water. Smelly substance content of waste air is lowered appreciably, e.g. to 7.4% as opposed to 66% without adding 1% polyethylene glycol-sorbitan laurate to washing water for scrubbing mashing- pan vapours. (15pp)

DAIK ★ D22 80009 D/44 ★EP --37-939
Surgical multifilament suture with good slipping properties - having baked tetra:fluoroethylene copolymer in its interstices

DAIKIN KOGYO CO LTD 26.03.80-JP-039220
A96 F06 P34 (A14) (21.10.81) A611-17
26.03.81 as 102284 (558KB) (E) GB1511425 GB1281592 E(CH DE FR LI)

A surgical multifilamentous suture has incorporated in its interstices 1-30 wt.% a tetrafluoro-ethylene copolymer of mean particle size 100-500 millimicrons, the portion of the copolymer present at least in the vicinity of the suture surface being baked.

The suture has good slipping properties (low coefficient of friction) and good knotting characteristics. It retains the polymer particles free of deformation, esp. without formation of fine fibrous whiskers, even when subjected to an external force, unlike conventional PTFE-impregnated sutures.

The use of a copolymer of tetrafluoro-ethylene and at least one of hexafluoro-propylene, perfluorovinyl ether, ethylene and propylene, e.g. a tetrafluoro-ethylene-hexafluoro-propylene (95:5-80:20) copolymer, is claimed. (17pp)

2-Cyclopentenone derivs. of formula (I) are prepd. by decarboxylating 5-(cis-2-pentenyl)-2-cyclopentenone deriv. of formula (II). Pref. 5-(cis-2-pentenyl)-2-cyclopentenone deriv. is decarboxylated using acid catalyst pref. at least one of p-toluene sulphonic acid, benzene sulphonic acid, HCl, H2SO4, formic acid, acetic acid, BF3, AlCl3 or ZnCl2, to give 2-cyclopentenone deriv. of formula (III) alternatively 5-(cis-2-pentenyl)-2-cyclopentenone deriv. is decarboxylated using NaCl to prepare a mixt. of 2-cyclopentenone derivs. of formulae (IVa) and (IVb).

In the formulae A is gp. (A1) or (A2), R2 is opt. branched alkyl, alkenyl or aralkyl, R1 is 1-6C branched chain alkyl.

(I) have jasmine-like fragrance and are used in perfumes. (10pp)

CORP ★ D23 80385 D/44 ★ GB 2074-183
 Prepn. of high quality crude corn oil - by milling wet corn germs under controlled temp. and pH, then sepg. solid and liq. with leaching forces

CPC INTERNATIONAL INC 18.04.80-GB-012909

(28.10.81) C11b-01/10

10-24-80 as 012909 (172AT)

High quality crude corn oil (I) is prepd. as follows (a) wet corn germs obtd. from the corn wet milling process and of pH 3-4 are milled at not above 50 deg.C (until at least 80% of the germs are of particle size less than 160 microns and the germ cells are opened but the cell walls are otherwise intact) so that at least in the final stage of the milling sufficient additional H2O is present to give an aq. slurry contg. 10-25% by wt. solids; (b) the milling slurry (with additional H2O if necessary to give solids content not above 17%) is subjected to milling leaching forces to separate the slurry into a solid phase, and a liq. phase contg. all the oil and most of the protein; (c) the liq. phase is promptly sepd. and the oil is recovered.

Step (a). Milling is pref. until at least 90% of the germs are reduced to less than 160 microns. Step (b). Leaching force is pref. centrifugal of at least 100 g, and the device producing the force is one to keep liqs. and solids in an agitated state (e.g. solid bowl centrifuge). Leaching step is pref. repeated at least once. Step (c). Sepn. is pref. with a 3-way centrifuge.

Process has low energy requirements, requires no chemical addns., and gives a very high quality crude (I) which needs only mild refining to give a final edible (I). (7pp)

Machine dishwashing compsn. comprises (i) 1-99.5 wt.% of a builder; (ii) 0.5-60 wt.% of a material yielding halite ions in aq. medium; (iii) sufficient alkaline material to give the compsn. a pH of at least 7.0 when dispersed at 0.5 g/l in water; opt. (iv) up to 40 wt.% of a surfactant and opt. (v) up to 98.5 wt.% of a liq. base.

The builder (i) is e.g. water-soluble orthophosphates, pyrophosphates, tripolyphosphates, metaphosphates, polymetaphosphates etc. of alkali metals or hydrates of these. (ii) are chlorites (or bromites) of alkali(ne earth) metals of opt. substd. ammonium, esp. Na chlorite.

The compsns. may be liq. or solid and are stable on storage. The compsns. are used at a concn. of 0.5-10 g/l to give

dishwashing compsns. which are activated by exposure to UV, either before use or whilst in contact with the dishes. After activation, the compsn. have good stain removal, cleaning and germicidal action. (14pp)

Prod. of fatty acid soaps in granular form - by reaction with metal base in presence of small amt. of water

PIETRALLA N (CWMB) 04.04.79-DE-913592

E12 (13.10.81) *EP--17-827 C08h-17/36

27.03.80 as 134194 (931PW)

A granulate metal soap or soap mixt. is produced by reacting 1 or more 8-22C aliphatic carboxylic acid with 1 or more soap-forming metal oxide, hydroxide or carbonate, in the presence of water at an elevated temp., then removing the water. The process comprises heating a reaction mixt. contg. the carboxylic acid and the soap-former with 1-5 wt.% of water w.r.t. the carboxylic acid, to a temp. initiating soap formation. The reaction is allowed to proceed under built-up over pressure without further external heating, and the pressure is then removed. The water is then removed under reduced pressure and the prod. formed.

The prod. is formed without a high dust content, nor a dark colour. The prod. may be opt. coated with lubricants as a granulating additive in the same reactor after the water has been removed. (3pp)

*Includes numbered Basics from Week D38

Arrangement of Abstracts

'MAJOR' COUNTRIES – An alerting abstract of every basic document is provided, and of examined equivalents from West Germany, Great Britain, Japan, the Netherlands and the United States, and granted and unexamined European and unexamined PCT equivalents. The abstracts are arranged in CPI class order and within any one of the 135 classes are in country and patent number order.

'MINOR' COUNTRIES – Basic headings are included in sequence with the entries from the 'Major' countries.

CPI Section Headings

See inside cover for further details.

A	Polymer Chemistry	F	Textiles, Paper, Cellulose
AE	Polymer & General Chemistry	G	Printing, Coating, Photographic Chemistry
A+	Polymer Applns.	H	Petroleum
B	Pharmaceuticals	J	Chemical Engineering
C	Agricultural Chemistry	K	Nucleonics, Explosives, Protection
D	Food, Disinfectants, Detergents	L	Refractories, Ceramics
E	General Chemistry	M	Metallurgy
E+	General Chemistry Applns.		

Typical Abstract Heading

See CPI/WPI Instruction Manual No. 1A for explanation of the various flagged descriptors.

Spreading layer of paste on band for cooking crepe etc. - with fine adjustment of thickness by heating contact zone of band

LECORA AB 30.06.80-SE-004824

P42 (16.10.81) B05d

22.06.81 as 889330 (448DH)

Process and a machine is described for spreading a mixt. of edible paste in a layer of uniform thickness on the upper surface of the flat, endless conveyor band. The band carries the layer to a cooking oven. A length of the upper run of the conveyor band is heated across the full width of the band. Within this length, the upper surface of the band is brought into contact with the mixt. of edible paste.

Pref. adjustments are provided to extend the length of contact between band and mixt. to increase the thickness of the layer and to shorten the length of contact to reduce the thickness of the layer. The thickness of the layer can also be increased by slowing down the speed of the band and the layer thickness decreased by speeding up the band.

Useful in industrial prodn. of pancakes, crepes, etc. The layer is uniform in thickness which can be precisely regulated by controlling the degree of coagulation of mixt. In the heated contact zone. (12pp Dwg. No. 1)

Baking oven control switch - with drum controller and friction coupling for temp. regulator

EGO REGELTECH GMBH 25.04.80-DE-016032

T06 X25 Q63 Q74 (X27) (29.10.81) A21b-01/40 F16d-07 F24c-07/08 G05g-07/02 H05b-01/02

25.04.80 as 016032 (39HM)

A switch and control device, specially for baking ovens, consists of a drum controller carrying several cams for operating the contacts for ancillary operations. A friction coupling joins the controller spindle to a temperature regulator. The mating coupling faces are so designed that the drum controller can be turned further after the temperature regulator has reached its ON position. At the same time, the coupling is prevented from turning back relative to the temperature regulator.

This switch can be produced and assembled at low cost. (15pp)

Baker's oven with vertical stack of compartments - with rotating shaft carrying perforated supported in each compartment

WILLETT P 25.04.80-GB-013835

(04.11.81) A21b-01/44

25.04.80 as 013835 (295BZ)

A baker's oven comprises a casing defining a vertical cylindrical interior divided by spaced horizontal heat-insulating decks into superimposed cylindrical compartments. Each compartment has a loading doorway. A shaft passes vertically through all of the compartments and carries within each compartment a perforated, horizontal, circular support for articles to be baked. A cylindrical heat-insulating core is mounted in each compartment disposed coaxially about the shaft and extending upwardly from the support to adjacent the top of the compartment. Electric heating elements are mounted on the bottom and top of each compartment. The shaft is rotated to simultaneously rotate all of the supports.

The oven is compact and each compartment can be provided with its own controls so that a variety of products each with different baking requirements, can be baked satisfactorily simultaneously. (6pp)

Q32 (22.10.81) A23l B65d
 22.04.81 as 888526 (448DH)
 The ham is pushed from a loading box, through an extrusion tube into a progressively extending tube of film released from accordian pleated store of tube loaded coaxially on the exterior of the extrusion tube. The extrusion tube has a bell-mouthed entry in one end of the loading box. The loading box has a powder closed cover and a mobile back plate which is the head of a power cylinder ram. The ham is placed in the open loading box.
 The cover is brought down and the profiled back plate advanced to size the ham for entry into the bell mouth of the extrusion tube. The end of the loading box opposite the bell mouth houses a two stage fluid power ram head. On its first stage the ram head advances to push the ham into the extrusion tube.
 On its second stage, a reduced area of ram head advances through the extrusion tube to expell the ham into the extending tube of wrapping film. The extrusion tube has vents to allow air to escape as the ham is pushed into the tube towards a sealed end of wrapping film. Fully automatic wrapping of boned hams etc. at high speed, e.g. 10 hams per min. is achieved. (32pp)

GEFL- ★ D12 81704 D/45 ★DD -149-998
 Poultry heading machine - compensates for various neck lengths by spring loaded guard
VEB GEFLUGELWIRTS 08.04.80-DD-220279
 (12.08.81) A22b-03/08
 08.04.80 as 220279 (39TM)
 A heading machine for poultry precedes the circular cutter blade by a curved tensioning guard with a centre of motion parallel to the axis of the cutter blade and loaded by a tension spring. Its longer lever arm ensures that the neck of the poultry is approached to the cutter blade only when the head contacts the under side of the guide rails.
 This compensates for any variation in the neck length, and makes the machine suitable for large poultry such as geese and turkeys, without wasting any edible meat. (7pp)

IKAR/ D12 13622 C/08 = J8 1043-211
 Frozen fish prepn. - by spraying with low temp. aq. soln. of propylene glycol
IKARI M 21.06.78-JP-074153
E17 (09.10.81) *J55003-723 A23b-04/08
 21.06.78 as 074153 (TM)
 Method comprises spraying aq. propylene glycol soln. contg. 38-45 w/w% propylene glycol and precooled to -17 to -25, esp. -20 to -21 deg.C on fish while the cellular tissue can reject the permeation of propylene glycol. If necessary, defoaming agent is added to the aq. propylene glycol soln. After spraying the aq. propylene glycol soln. is recovered and filtered and after adjusting its concn. to 38-45 w/w% with fresh propylene glycol, is recycled.
 Freezing time can be greatly shortened. Fish can be frozen while preventing oxidation and decrease in wt. due to drying. Due to the antibiotic activity of propylene glycol the frozen fish can be preserved safely. The frozen fish have excellent appearance and taste and can be frozen in large quantities.

23.04.80 as 015537 (280AS)

Rapid determination of dissolved aflatoxins is effected by chromatography on a mini chromatographic column and comparison of the colour or fluorescence intensity of the resulting aflatoxin zones or bands with those of chromatogram zones or bands of a standard substance in known, graduated concns. in a similarly fitted control column, the colour or fluorescence intensity of the standard substance corresponding substantially to those of the aflatoxins to be determined.

The mini chromatographic column is filled, in order (bottom upwards) with a layer of glass wool, granulated sodium sulphate, magnesium silicate gel (Florisil(RTM)), silica gel, neutral alumina, granulated sodium sulphate and a sealing layer of glass wool and is activated by heating 2 hrs. at 110 deg. A measured amt. of the solution mixture to be examined for aflatoxins is applied to the column, then the column is developed by descending chromatography using a suitable solvent mixture.

Used for determination of aflatoxins, esp. in plant and animal extracts, e.g. to determine aflatoxins B₁, B₂, G₁ and G₂ in foodstuffs.

Simple and rapid procedure which, because descending chromatography is used, permits the amount of developing solvent to be accurately measured and therefore gives improved reproducibility. (30pp)

HAYE/★ D13 81796 D/45 ★DE 3015-712
Casein prodn. from milk - with concn. step to remove water, lactose, salts and non-protein nitrogen

Protein-contg. fodder prodn. - from suspended or dissolved organic substances in two stages of activation and settling followed by drying

POPPINGHAUSK 23.04.80-DE-015515
C03 (28.10.81) A23j-01 A23k-01 C02f-03/12 C02f-11 C12n-01 C12p-21
10.04.81 as 102734 (236RH) (G) No-Citns. E(AT BE CH DE FR GB IT LI LU NL SE)

Method of obtaining protein-contg. animal fodder from organic substances dissolved and/or suspended in water utilizes at least two successive stages (I,II) in which biological treatment is carried out in an activating tank followed by a respective settling tank.

In the first stage (I) a larger proportion of the bacteria are protozoa; the sludge is removed intermittently and alternately from the first and second stages and is fed to a drier; from this a portion of the dried sludge is recycled back to the inlet of the stage from which it was obtd.

In at least one of the activation tanks, esp. that in the first stage (I), additives to promote the growth of microorganisms, esp. trace elements and/or minerals are added; after drying a chemical agent is added to the sludge to render the cell walls of the microorganisms brittle and/or break them down in some other way.

Pref., the starting material used is liq. manure at inlet the organic substances may be diluted with 2-10 (4-6) times their own quantity of water. In each stage, a proportion of the microorganisms and waste material may be recycled back to the inlet of the same stage, the remainder being used for producing fodder. The residual discharge from the second stage may pass to a biological sewage treatment plant. This may be followed by an ultraviolet disinfection plant.

Low energy cost and high prodn. of an easily digested fodder are achieved. An external water source, esp. of purified water, is not necessary. (19pp)

14.04.81 as 200431 (1248BZ) (E) No-Citns. E(AT BE DE FR GB IT NL)

Prods. showing reduced water activity comprise codried blends of a first compsn. comprising at least 65% of a derived protein-contg. compsn. (I) from plant or animal sources. Comspn. (I) has a molecular wt. below 30,000, a total Kjeldahl N content of 0.45-2.1 (at least 60% the N is non-protein N). First compsn. also contains 0.35% of (a) 1-15% gelatin or (b) 1-15% gelatin and 5-25% water-soluble polyphosphate (together not being over 35%) or (c) 0.5-5% gum, or their mixts.; and 0-30% whipping aid. All percentages are by wt. based on the total wt. of the first compsn. Together with 20-75% by wt., based on the dry wt. of the prod., of a starch that is soluble or swellable under the drying conditions.

The codried prods. are useful as humectants and flavour enhancers for foods and can be used as egg albumin extenders in soft meringues. They are bland to slightly salty and do not cause flavour problems, even when added to foods in large amounts. They are useful in intermediate moisture foods such as pet

foods. The first compsn. has similar properties and uses. (38pp)

KURE★ D13 81943 D/45 ★EP --38-628
De-N-acetylated chitin and fibrous collagen composite - useful as edible food casings, therapeutic agents, enzyme carriers etc.

KUREHA KAGAKU KOGYO 21.03.80-JP-036712 (21.03.80-JP-036711)

A11 B04 (A96 A97) (28.10.81) C081-05/08
20.03.81 as 301212 (1248BZ) (E) No-Citns. E(DE FR GB NL SE)
Composite material (I) comprises de-N-acetylated chitin (II) and fibrous collagen (III). The (III) may be crosslinked or acylated. Material (I) may also comprise gelatin and/or soluble collagen.

Material (I) is obtd. by contacting (II) with (III) in an acidic medium, then the mixt. is de-acidified. The gelatin and/or soluble collagen may also be present. Either (II) in aq. acid is mixed with an aq. dispersion of (III) or a material made of (III) is immersed in the soln. The acid is removed by evapn. or electrodeposition. The prod. may be crosslinked or the (III) may be crosslinked in a pre-treatment, e.g. by using glutaraldehyde, dialdehyde starch, etc.

(I) do not dissolve in aq. salt solns. and can have good mechanical strength that is not partic. reduced in hot water. They are not absorbed by living bodies, coagulate blood, resist attack by bacteria, possess film-forming ability and adhere closely to stuffed materials such as meat. They are useful for forming edible casing material for foods, to which they may be added in spherically shaped or fibrous form. They may be useful as prophylactic or therapeutic agents for (a) returning raised serum cholesterol levels to normal, (b) inhibiting rises in blood sugar levels, (c) removing growth-inhibiting substances, and (d) preventing cancer of the colon.

The material, esp. in film or fibre form is thrombogenic, but it may be treated with heparin to make it antithrombogenic for use in artificial skins, artificial kidneys and blood vessels, etc. Materials (I) may also be used to absorb proteins such as enzymes and micro-organisms, which may be in immobilised form. (39pp)

PAVL★ D13 81972 D/45 ★EP --38-684
Additive for improving whipping props. of egg whites - contg. whipping protein, thickening agent, and edible acid

PAVLOVA PANTRY MARK 21.04.80-AU-003204
(28.10.81) A231-01/32
16.04.81 as 301689 (478) (E) GB1463113 FR2215176 US4200663 DS2406376 US3219457 GB1194941 EP-12490 E(AT BE CH DE FR GB IT LI LU NL SE)

Additive for improving the whipping props. of an egg-contg. food prod. contains a whipping protein (I), a seaweed-derived thickening agent (II), and an edible acid (III). Pref. additives contain (by wt.): 2-5 esp. 3-4 pts. (I); 1.5 esp. 2-5 pts. (II); and 1-10 esp. 2-3 pts. (III); and opt. also 0.5 esp. 3-4 pts. gelatin or vegetable gum, 0-20 esp. 10-14 pts. cornflour, and 0-20 esp. 10-14 pts. glucose. Amts. of additive used are (all to 1200 ml. egg material); 3-20 pref. 5-10 g. with unpasteurised liq. egg; 7-40 pref. 15-20 g. with pasteurised liq. egg; and 10-70 pref. 25-35 g. with albumen and H2O.

The additive gives quicker whipping times of egg whites with more consistent results (esp. in the prepn. of pavlovas). In addn., the foam is more stable and can be left for a longer time before cooking. The additive allows the introduction of a variety of 'instant' powder mixts. for souffles, baked Alaskas, and pavlovas, etc. (24pp)

LAIT★ D13 81991 D/45 ★EP --38-732
Acidulated milk with low mineral content - made by treating fresh milk with cation exchange resin, useful for addn. to milk to form casein coagulate

LAITERIES BRIDEL E 31.03.81-FR-006470 (17.04.80-FR-008644)
(28.10.81) A23c-09/14 A23j-01/20

02.04.81 as 400526 (513HM) (F) No-Citns. E(AT BE CH DE GB IT LI NL SE)

Acidulated decationised milk is claimed having the same protein and lactose content as ordinary milk, but with a very low mineral content of less than 4 g/l, a Ca/P ratio of less than 0.5 and a pH of less than or equal to 3.8. The milk is obtd. e.g. by treating milk at 0-4 deg. C with a cation exchange resin in acid form until the pH of the milk is less than or equal to 3.8, esp. 1.5-3.5.

Pref. ion exchange resin is a polystyrene resin carrying sulphonic acid gps., with a gel or macroporous structure. The treatment is carried out e.g. by percolation or in counterflow using a vol. ratio of (pref. skimmed) milk to exchange resin of 5:1 to 15:1.

The decationised milk is esp. useful in the prodn. of casein and lactoserum by mixing ordinary milk with an amt. of the decationised milk sufficient to lower the pH of the mixt. to around the isoelectric point of milk casein (4.4-4.6) and heating to 10-60 deg. C to coagulate the casein in the mixt. followed by heating to 100 deg. C to sterilise the curd. (24pp)

the casein and the lactoserum.

Process allows rapid prodn. of cheese or curds from milk and avoids drawbacks associated with prodn. of casein by acidulation of milk with exchange resins using prior art processes. (26pp)

SAGM/ ★ D13 82019 D/45 ★EP --38-792
Mycotoxin-binding agent for addition to food- and feedstuffs - contg. a mixture of crosslinked vinyl-pyrrolidone homo:polymer and an inorganic substance with large internal surface

SAGMEISTER F 23.04.80-AT-002183

A97 C03 (28.10.81) A21d-15 A231-03/34 C081-39/06

01.04.81 as 890057 (280RH) (G) US2938017 DE2443530 DE2318446 DD-114343 E(AT BE CH DE FR GB IT LI NL)

New mycotoxin-binding mixt. contains (a) an inorganic substance with large internal surface and (B) a crosslinked homopolymer of N-vinyl-2-pyrrolidone.

Used for binding of mycotoxins from fungus-affected food- and feedstuffs in order to render them edible. The binding agent is pref. added to the food- or feedstuff before it is consumed, but may also be administered before or after consumption of the food- or feedstuff.

Pref. mixts. contain more than 50 (esp. 70-90, partic. 80) wt.% crosslinked N-vinyl-2-pyrrolidone homopolymer. Pref. inorganic substances are kieselguhr, synthetic silicic acid, silicates (such as magnesium or aluminium silicates, e.g. precipitated aluminium silicate, Al₂SiO₅), aluminium oxide and magnesium oxide. (36pp)

NEST ★ D13 82023 D/45 ★FR 2478-952
Textured protein prod., esp. of soya or fish - prepd. by treating protein in semipermeable cover with osmotic agent

SOC PROD NESTLE SA 31.03.80-CH-002522

(02.10.81) A23j-03

11.03.81 as 004861 (597HM)

Prodn. of textured protein prod. from a three-dimensional protein material, comprises exchanging the water in the material with an aromatic agent by wrapping the material in a semipermeable covering which is sealed and then immersing it in a soln. of an aromatic agent.

The process is applied e.g. to soya curds and fish fibres. It enables a compact texture. The prod. used in the prepn. of food prods, is neither deformed, disintegrated, nor dissolved in aq. environment. Also the prod. in the case of the above examples loses its soya and fishy taste respectively (13pp)

MILL/ ★ D13 82024 D/45 ★FR 2478-953
Animal feed from abattoir, dairy, preserving floating sludge - by submitting acid sludge to decantation, then mixing with nitrogenous substrate and premixes to give liquid or solid feeds

C03 (02.10.81) A23k-01

31.03.80 as 007161 (395HM)

Process for the production of animal feeds from mineral and organic by product floating sludges, suspended in agricultural-food industry effluents (esp. from abattoirs, preserving plants and dairies) and having pH 1.8-7, by submitting the floating sludges recovered from the effluents to at least one decantation, such that the dry material content of the decanted sludge is 8-12%; then mixing the decanted sludge with sufficient quantity of a substrate having a suitable dry material content so that the resulting food mixture has a dry material content of 25-50% and optionally adding other food compounds to give a feed material suitable for animals.

Preparation of animal feeds from organic/mineral by-products recovered from abattoir, preserving-plant and dairy effluents by flotation. (25pp)

LAND/ ★ D13 82025 D/45 ★FR 2478-954
Animal lick contg. magnesium sulphate and other salts - is prepd. by mixing powdered salts, addn. of water converting the mixt. to a solid licking stone

LANDRIVON H 26.03.80-FR-007259

C03 (02.10.81) A23k-01/17 C01f-05/40

26.03.80 as 007259 (395MR)

Mineral feed complement for animals, which contains Mg and is presented as a licking stone, is characterised in that at least part of the Mg in the original mixt. is in the form of magnesium sulphate. Pref. the compsn. contains dicalcium phosphate, sodium chloride, various metallic sulphates, magnesium oxide and 5.5-15% of magnesium sulphate. The compsn. comprises a powder mixture, which is converted to a solid body by dissolving the powder in 35-45% water.

Pref. compsns. contain as parts by weight CaHPO₄ 600, NaCl 210, MgO 80, MnSO₄ 100, ZnSO₄ 12, CuSO₄ 2 and flavours (minute quantities). The cpds. are mixed intimately in sacks e.g. 25 kg sacks. For use such as 25 kg sack may be placed in a bucket or tub, contg. about 10l of water, and after 48 hrs. forms a solid of suitable hardness.

Used as a mineral lick for animals, that is economic to produce and is transported as a powder, which may be converted to the solid licking stone by addition of water. (5pp)

VALB/ ★ D13 82026 D/45 ★FR 2478-955
Effervescent prod. contg. at least two reactants for aerated drinks - in frozen liq. form such that reactants cannot react

VALBONESI F 26.03.80-FR-006710

(02.10.81) A231-02/40

26.03.80 as 006710 (597HM)

Effervescent prod. contg. at least 2 reactants producing an effervescent effect is frozen in liq. form such that reactants are unable to react. An effervescent granule comprises the reactions encapsulated in a coating which gives delayed release of the reactants.

The prod is used to prepare aerated drinks. It enables instant aeration without any storage problem for the reactants, which normally required storage in anhydrous conditions. (7pp)

GOUP/ D13 58774 A/33 = GB 1601-656
Chewing gum contg. water soluble fluoride - xylitol, gum base and pref. sorbose or sorbitol

Novel composite ice confections comprise a gel and ice confection in which the gel has the approx. shape of a half fruit with a depression in its flat upper surface. The ice confection is located positively engaging the depression.

Pref. the depression is irregular and the ice fits the irregularities. Pref. the depression simulates the hole left by a removed stone. (3pp)

BUTL-★ D13 82117 D/45 ★GB 2074-435
Treating of cheese offcuts - by comminution followed by pressing in evacuated environment to form reconstituted block
BUTLAND INDS LTD(SCHR-) 18.04.80-NZ-193481
P13 (04.11.81) A01j-27/04 A23c-19/08
09.04.81 as 011183 (295BZ)

Cheese is fed to a comminutor, the resultant pieces being pressed in an evacuated environment so that a bonding or agglomeration occurs between adjacent pieces to form a reconstituted cheese block. Pref. the pieces are comminuted by forcing the cheese through an apertured plate over the exit surface of which passes a rotating cutter. The pieces are pref. pressed through a converging nozzle into a chamber where a hydraulically driven ram compresses the cheese and passes it out through an exit aperture which has a smaller cross-sectional area than that of the ram chamber.

Used particularly for processing cheese off-cuts. (6pp)

HOWA/★ D13 82118 D/45 ★GB 2074-436
Expanded cereal snack foods - comprising cooked dough contg. gelatinised starch and bran
HOWARD AN 13.04.81-GB-011513 (26.04.80-GB-013858)
(04.11.81) A23l-01/10
13.04.81 as 011513 (367BZ)

Expanded snack food with an oil or fat content of at least 5 wt.% comprises discrete cooked portions of a dough comprising gelatinised starch and added cereal bran (excluding rice bran). The snack food has a high fibre content while having a palatable fried flavour and a crisp-like texture. It has a lower fat content and thus a lower calorific value than similar products not contg. bran. (7pp)

TRUB★ D13 82119 D/45 ★GB 2074-437
Porous absorbent sheet impregnated with e.g. biocide - for application to plant wounds
TRUBENISED GB LTD(PREP-) 24.04.81-GB-012761 (25.04.80-GB-013687)
C03 (04.11.81) A01n-03 A23b-07
24.04.81 as 012761 (476BZ)

A wound in plant matter is treated by application to it of a porous absorbent sheet material having on at least one surface an intimate mixture of biologically active material and a Latex coagulant. A suitable sheet comprises a porous web having, on one or both surfaces, a dry coating comprising an intimate mixture of a water-soluble adhesive polymer and the two materials already specified, or with the coagulant absent.

Plant wounds caused e.g. when certain fruit and vegetables are harvested or when a living tree or bush is cut tend to bleed juices, latex and other plant fluids which can spoil the appearance of the crop e.g. bananas, and also act as a point of attack for pathogenic organisms such as *Fusarium semitectum*, and the present method is an improvement in their treatment over the known direct application of e.g. a fungicide after washing e.g. of banana hands, or the dipping of the crown of banana hands into an aluminium sulphate soln. Coated webs according to the invention in which the active material is a bacteriostat and/or bactericide may also be used as sterile medical dressings. (4pp)

BENC★ D13 82140 D/45 ★GB 2074-532
Tea-bags made of treated paper - contg. sequestering agent for polyvalent metal ions

E34 Q34 (E19) (04.11.81) B65d-81/34

05.03.81 as 006928 (367BZ)

Tea-bags are formed of paper contg. a substance (I) capable of complexing polyvalent metal ions, where (I) is pref. an alkali metal polyphosphonate and/or a hydroxy carboxylic acid or an alkali metal salt thereof. (I) is suitably a polyphosphonate of formula $(M)n + 2(P)n(O)3n + 1$ (where M is Na or K and $n = 2-80$) and/or tartaric, citric or gluconic acid or their alkali metal salts. The paper for one tea-bag pref. contains 0.5-4.0 mg of (I), which can be incorporated during mfr. of the paper or by impregnation of the paper.

(I) softens the water in contact with the tea-bag, thereby improving the flavour and appearance of the tea infusion. (3pp)

ODAI/★ D13 82143 D/45 ★GB 2074-558
Altering the compsn. of peat to make fertiliser or animal feed - by using a mixt. with cereal to cultivate edible mushrooms

ODAIRA K 28.03.80-JP-040843 (21.03.80-JP-036527)
C03 (C04) (04.11.81) A23k-01 C05f-11/02

19.03.81 as 008687 (476KB)

A livestock feed or fertiliser is made by altering the compsn. of peat by mixing it with 10-40% of its wt. of cereals or brans, using this mixture to culture the hyphae of an edible mushroom, germinating the resulting fruit bodies and removing these from the culture bed to leave a residue which may be crumbled and used as livestock feed, or further fermented for use in a fertiliser.

The altered peat contains very little indigestible matter such as imide fibrous matter and lignin and has an increased content of soluble nitrogen-free substances. (5pp)

BUHL★ D13 82192 D/45 ★GB 2074-761
Control of gap width between two rolls - initially by variation in roll temp. but if insufficient by pressure variation

BUHLER GEBR AG 30.04.80-DE-016786
J02 T06 X25 P41 (D21) (04.11.81) B02c-04/36 G05d-05/02

28.04.81 as 012978 (295AT)

The gap width between two parallel cooperating rolls in a multiple roll mill is regulated. The rolls contain variable intensity heating and/or cooling appts. and can be clamped together or moved apart by a hydraulic piston-in-cylinder arranged between adjacent ends of the rolls and subjected to a control pressure.

A predetermined rolling pressure and roll gap are selected for a particular job. On change of the gap width during the rolling process, the intensity of cooling and/or heating is first adjusted without changing the rolling pressure to aim to restore the predetermined roll gap. If the range of temp. variation is not sufficient, the rolling pressure is charged to restore the gap width.

The multiple roll mill may have from three to five rolls and serve to crush, disperse, mix or homogenise pasty masses such as chocolate. Similar mills can also be used to process printing dies, paint colourings, pigment dispersions, crayon compsns, coating compsns, toilet soap, confections etc. (6pp)

 Elastic gelatinous substance prepn. - by adding calcium salt to aq. salt to aq. soln. of polysaccharide prepd. from *Alcaligenes faecalis*
TOKUYAMA SODA KK 27.02.80-JP-022646
(D16) (24.09.81) A23l-01/04 C12p-19/04
 27.02.80 as 022646 (5PW)
 The method comprises adding soluble calcium salt to aq. soln. of the polysaccharide prepared from *Alcaligenes faecalis*. Gelatinous substance which is elastic and has excellent in form-holding property, can be prepared without using acid and/or heating. The method can be applied for preparing jellies.
Alcaligenes faecalis can be cultured at 25-35 deg.C at pH 6-7 aerobically for 3-4 days. After the culture the polysaccharide in the culture medium can be sepd. by removing the microbial body and precipitating it with water soluble organic solvent such as ethanol, methanol, acetone etc. The polysaccharide is formed into aq. 0.01-0.05 wt.% soln. and soluble calcium salt such as calcium chloride, calcium acetate, calcium lactate, etc. is added in amt. of above 0.1 wt.% to the soln. (4pp)

AJIN★ D13 82358 D/45 ★J5 6121-453
 Sepn. of stevioside and rebaudioside A - by crystallising mixt. in aq. (m)ethanol, adding obtd. crystals to water and recovering solid stevioside
AJINOMOTO KK 27.02.80-JP-023755
B03 E13 (24.09.81) A23l-01/22 C07h-01/08
 27.02.80 as 023755 (5RP)
 The method is effected by (a) crystallising the mixt. of stevioside and rebaudioside A either in aq. 45-80% methanol soln. or in aq. above 85% ethanol soln. (b) adding thus obtd. mixt. of beta-form crystalline stevioside and alpha-form crystalline rebaudioside A in water, (c) dissolving rebaudioside A alone in water and (d) recovering undissolved stevioside.
 The sweet substance extracted from the plant, *Stevia rebaudiana* Bertoni is the mixt. of stevioside and rebaudioside A and the sweetness of rebaudioside A is not only stronger, but also better than that of stevioside. The solubility of stevioside in water is 5-10 g/100 g water for alpha-form and 0.2 g/100 g water for beta-form and that of rebaudioside A is 5-10 g/100 g water for alpha-form and 0.3 g/100 g water for beta-form. (6pp)

AJIN★ D13 82359 D/45 ★J5 6121-454
 Sepn. of stevioside and rebaudioside A extracted from *Stevia* plant - by dissolving in aq. soln. contg. more than 70 per cent ethanol, to separate out rebaudioside A
AJINOMOTO KK 27.02.80-JP-023756
B03 E13 (24.09.81) A23l-01/22 C07h-01/08
 27.02.80 as 023756 (5GW)
 The process involves dissolving a mixt. of stevioside and rebaudioside A in an aq. soln. of more than 70% ethanol and crystallising out rebaudioside A selectively from the soln. Highly pure rebaudioside A can be sepd. effectively in high yield by this simple process.
 The sweet substance extrd. from the plant *Stevia rebaudiana* Bertoni is a mixt. of stevioside and rebaudioside A and the sweetness of rebaudioside A is not only stronger, but also better than that of stevioside. The common solubility of stevioside and rebaudioside A in aq. ethanol soln. depends on the concn. of ethanol when the soln. contains more than 80% ethanol, rebaudioside crystallises out preferentially. Thus obtd. crystalline prod. has rebaudioside A content above 80% and stevioside content below 15%. The mother liquor has, of course, higher stevioside concn. than initially. (4pp)

AJIN★ D13 82360 D/45 ★J5 6121-455
 Crystallisation sepn. of stevioside-rebaudioside A mixt. - by dissolving in methanol soln. and selectively crystallising stevioside from soln.
AJINOMOTO KK 27.02.80-JP-023757
B03 E13 (24.09.81) A23l-01/22 C07h-01/08
 27.02.80 as 023757 (5AS)
 Process comprises dissolving a mixt. of stevioside and rebaudioside A either in aq. 40-70% methanol soln. or in aq. above 85% methanol soln. and crystallising out stevioside selectively from the soln. The sweet substance extracted from the plant, *Stevia rebaudiana* Bertoni is a mixt. of stevioside and rebaudioside A and the sweetness of rebaudioside A is not only stronger, but also better than that of stevioside.
 Stevioside and rebaudioside A can be sepd. effectively in a simple process utilising the difference in the solubility in aq. methanol soln. (3pp)

NIPS★ D13 82401 D/45 ★J5 6121-634
 Oxygen absorbent for protecting food - comprises iron powder and metal halide-coated filler, e.g. diatomaceous earth

Nutrient medium for cultivating harmful eurygasters for agricultural investigations, is based upon a complex mixture of organic materials. Both size and development of the pentatomids are inhibited by adding ro pyO-methyl, S- (2,3,5-trichloridyl-4-thiol)- benzylphosphonate (A) emulsified in Tween-60.
The medium comprises (in wt.%): wheat germ 49.5-50.5, brewing yeast autolysate 19.5-20.5, saccharose 9.5- 10.5, (A) 0.04-0.08, Tween-60 0.4-0.6, methyl p-hydroxy- benzoate 0.19-0.21, 20% formalin 0.23-0.25, remainder - pure water.
When eurygaster larvae are reared on the proposed nutrient, the survival rate of adult bugs is reduced by 14-18%; the development period of the larvae is extended by 6.6-7.2 days; the

Imago wt. of females is reduced on average by 25.2 mg. and of males by 13.5 mg. Nutrient consumption is reduced 12-15 fold. Bul. 6/15.2.81. (3pp)

Nutrient for culturing of eurygaster insects - contg. addn. of di:methyl-nonyl-sulphonium methyl sulphate and ethanol as growth inhibitors, useful in agricultural pest control
NORTH CAUC PHYTOL 07.09.79-SU-810686
C03 P14 (15.02.81) A01k-67

07.09.79 as 810686 (835VE)

In agricultural nutrient for rearing harmful eurygaster insects is based upon a complex mixt. of organic materials. Both size and development of the pentatomids are inhibited by adding dimethylnonyl-sulphonium methylsulphate (A) and ethanol. The nutrient for controlled insects culturing comprises (in wt.%): wheat germ 49.0-51.0, brewing yeast autolysate 19.0-21.0; saccharose 9.0-11.0, (A) 0.1-0.3, ethanol 0.45-0.55, methyl p-hydroxybenzoate 0.15-0.25, 20% formalin 0.22-0.26, remainder - distilled water.

When eurygaster larve are reared on the proposed nutrient, insect viability falls by 6%; the development period of the larvae is increased by 12.3 days; the imago wt. of females is reduced by 32.9 mg. and of males by 27.5 mg. Nutrient consumption is reduced 5-7 fold. Bul. 6/15.2.81. (3pp)

NCAU = ★ D13 82996 D/45 ★ SU-803-934
Administration of borax as feed additive for cattle - for inhibiting formation of urease and its effects in rumen when urea is added to feed also

NORTH-CAUC ANIM HUS 26.04.79-SU-785954

C03 (15.02.81) A23k-01/17

26.04.79 as 785954 (29MI)

Feedstuff additive for fattening ruminant animals comprises borax (sodium tetraborate - $\text{Na}_2\text{B}_2\text{O}_7 \cdot 10\text{H}_2\text{O}$), which inhibits formation of rumen urease during the feeding of urea.

The experiments involved 9 castrated bulls with live weights of 200 kg each, divided into three similar groups (1st gp. control; second and third test). The food given to the animals consisted of: corn silage, wheat straw, sunflower oil cake, beet sugar molasses, cooking salt. Calcium and phosphorus deficiency was made up by chalk and disodium phosphate. Each ration consisted of: nutrient units 6.5; digestible protein 605; sugar 600; Ca 35; P 22. The 1st group were fed the basic rations. For the 2nd and 3rd groups the sunflower oil cake was omitted and substd. by carbamide nitrogen which also made up for deficiency in digestible protein (25%). The animals in the 3rd group were also fed borax in an amt. corresp. to 7 g. per head per day, i.e. 3.5 g. borax per 100 kg. of body weight.

After 1.5 and 5 months, samples of rumen liquid were taken for analysis to determine the ammonia content (prior to feeding and 2, 4, and 6 hours after). The amt. of ammonia was used as the speed of hydrolysis of the urea. The use of the borax over a period of 5 months did not lead to any pathological shift in the organism. Rectal temp. pulse, breathing rate and contraction of the rumen in unit time were within the physiological norm. Bul. 6/15.2.81. (3pp)

 18.04.81 as 420058 (448RH) (F) FR2045236 FR1313172 FR2082779 FR1527855 GB1423958 FR1332744 E(AT BE CH DE GB IT LI LU NL SE)
 A special support rack and an installation for the automatic filling and packing of fresh cheese into upwardly divergent coned pots. The prod. is of the type comprising a pot contg. a removable, perforated pot liner which is filled with curds and placed inside the pot where whey drains into the space between pot and liner.

The support rack can accommodate rank and file rows of liners. The rack comprises an upper grid separably superimposed upon a lower stillage. A liner positioned in the rack is suspended by its top rim flange resting on the top of the upper grid, the coned wall of the liner extending down through both grid and stillage, but not projecting below the stillage.

Racks filled with liners are stacked in a large tank where the liners are filled by flooding the tank with curds. Each rack in turn is raised from the tank. The stillage is automatically sepd. from the grid which retains the liners, now projecting below the grid surface. The liners are lifted automatically from the grid

and each filled liner automatically lowered into an individual pot. Manual ladling of curds into liners is eliminated. This saves labour and ensures consistent filling of the liners. (13pp)

US3573924 US3255975 US3174298 N(AU BR DE GB JP NL) E(FR)

The temp. of the feed to a pellet mill is measured simultaneously with the temp. of the prod. in the mill. These measurements permit the temp. rise of the mill to be calculated. A control network monitors this temp. difference and adjusts the addn. of moisture to the feed to maintain the difference within preset limits.

In other embodiments the temp. difference is used to adjust the rate of steam, water or dry heat added to the feed. Pref. the temp. sensor in the mill is protected from the pellets by a baffle.

The control network adjusts the rate an ingredient is added to the feed to maximise the productivity of a pellet mill. Typically a temp. difference of 12-120 deg. F is used. (11pp Dwg.No.1)

The centrifuged liq. of digested sludge from a centrifuge station is stabilised by hot compressed air in an aerobic basin together with thickened surplus activated sludge. It is then thickened in Dorr-type thickeners, fitted with agitator bars. The surplus activated sludge is recycled from surplus sludge thickeners and is admixed with a portion of the stabilised centrifuged liq. from digested sludge.

This treats the centrifuged liquid with a minimum of material

and power consumption. Smaller sludge dewatering spaces are needed and the reactions are not hampered in the cold season. (8pp)

Polymers of N-substd. unsatd. carbonamide(s) - useful as flocculants, de-watering aids, paper making additives, oil additives or as ion exchange resins

CHEM FAB STOCKHAU 00.00.81-EP-103346 (27.12.78-DE-856383)

A14 F09 (28.10.81) C02f-01/56 C08f-20/54

00.00.81 as 103346 (902BZ) (G) DE2233337 US4031138 FR2193787 US3856689 DE2819735 E(AT BE CH DE FR GB IT LU NL SE)

Addn. polymers are claimed of alpha, beta-N-substd. carbonamides of formula (I) and esp. of formula (I'). In (I) R₁ and R₂ are H or Me; Y is a divalent 2-30, e.g. 2-18 C strt.chain or branched organic residue, e.g. a gp. of formula -(Y₁)m-(Y₂)n-(Y₃)t where Y₁, Y₂ and Y₃ are alkylene gps. or the residue of a 5 or 6C ring system and m+n+t is 2 or 3; X is H or -N(R₄)(R₅) where R₄ and R₅ are 1-4C alkyl or 3-6C cycloalkyl.

In (I') R₁ and R₂ are as above; R₆ and R₇ are alkyl, (pref. 1-4C), esp. Me) or aryl or together form an aliphatic ring, esp. cyclopentyl or cyclohexyl; n is 0-10; and X is as above or -N+(R₃)(R₄)(R₅)A where R₃ is H or 1-4C; R₄ and R₅ are as above; and S is an anion.

Specifically claimed are homo- and co-polymers and the use of these as flocculation and sedimentation aids, sludge dewatering aids, retention- and dewatering aids in papermaking, mineral oil additives and as ion-exchangers.

Polymers made from cationic monomers of formula (I) or (I') are not only flocculation or dewatering aids but also serve as agentants for improving the dry- and wet-strengths of paper. In mineral oils they act as viscosity controllers and dispersants. When polymerised with crosslinkers they form anion exchange resins. Mol. wt. ranges are: flocculation and dewatering aids 5-10x10 power 6, papermaking additives 1-5x10 power, and other uses up to 10 power 6. (59pp)

Hollow filament separatory module - has layers of hollow filaments each disposed in a helix and ends encased in potting compound

ALBANY INT CORP 00.00.81-EP-200530 (19.09.78-US-943738)

A88 J01 (28.10.81) B01d-13

00.00.81 as 200530 Related to EP---9374 Filed 13.9.79 (+ 19.9.78-US 943739) (50DH) (E) No-Citns. E(AT BE CH DE FR GB IT LU NL)
Bundle of filaments (22) consists of a number of layers of semi-permeable hollow filaments, each layer disposed in a helix. A pressure resistant enclosure (32,34) encloses the bundle with end plates (36,38). The filaments have open ends and main portions with one fluid flowing over the outer surfaces of the main portions of the filaments and potting cpd. (66) encasing the ends of the filaments to cause fluid to flow within the filaments.

A collection chamber (71) is adjacent the potting cpd. (66) and an access surface (79) is formed on the potting cpd. for the open ends of the filaments. The area of the access surface (79) projected on a plane perpendicular to the direction of internal pressure forces against the potting cpd. is less than 50% of the area of the potting cpd. (66).

pd. parallel to the plane.

Used for sepn. of gas/gas, liq./liq. and liq./solid mixts. and solns. by permeable or semipermeable membranes. Module internal pressure acting against the potting cpd. is resisted by a surface of the potting cpd. at which no cut filament or fibre ends appear. Surface resisting the thrust may be at right angles to the principal axis of the module, and the cut ends of the fibres may be located at different elevation or at an angle to the surface of the potting cpd. required to take the pressure thrust. (27pp Dwg.No.2)

Hollow filament separatory module - has semipermeable tubular filament bundle with sealing rings preventing leakage of fluid concentrate

ALBANY INT CORP 00.00.81-EP-200531 (19.09.78-US-943738)

A88 J01 (28.10.81) B01d-13

00.00.81 as 200531 Related to EP---9374 Filed 13.9.79(+ 19.9.78-US-943739) (67DH) (E) No-Citns. E(AT BE CH DE FR GB IT LU NL)

The module comprises a helically wound annular bundle of semipermeable tubular filaments contained within a pressure resistant enclosure. Fluid concentrate to be sepd is supplied under pressure to the outsides of the filaments and the sepd permeate flows through open ends of the filaments into a collection chamber.

To prevent leakage of fluid concentrate from the supply to the collection chamber the ends of the filaments are embedded in potting cpd and two separate sealing rings are located in the enclosure between the concentrate supply and the collection chamber. A weep hole between the sealing rings vents any concentrate which may leak past the sealing ring nearest the concentrate supply.

Leakage of fluid concentrate in the sepd permeate which may arise because of the high pressure differential across the walls of the filaments is completely prevented. (24pp)

Separator for two immiscible liquids of different densities - partic oil from detergent fluids used for industrial degreasing of machined components

ETAB BARDET A SA 21.04.80-FR-008931

(28.10.81) B01d-17/02 C02f-01/40

16.04.81 as 400613 (448JB) (F) No-Citns. E(AT BE CH DE GB IT LI LU NL SE)

Installation for the sepn. of two immiscible liqs. of different densities, comprises a vessel internally partitioned to provide a sepg. chamber and reception chambers for heavier and lighter phases respectively. A mixt. is introduced to the sepg. chamber via a static distributor located between an upper collector for lighter phase and a lower collector for heavier phase. The sepd. phases are channelled from their collectors to corresp. reception chambers.

The sepg. chamber is partitioned from the rest of the vessel

space by an upwardly convergent, conical funnel at the top of the sepg. chamber. The space above the funnel is vertically partitioned into a lighter phase reception chamber contg. the top outlet from the funnel, and a heavier phase reception chamber. Used for industrial sepn. of oil polluting detergent cleaning fluids which have been used for degreasing machined metal component. Extremely compact design because no turbulence is created to oppose coalescence of minute oil globules. Sepn. efficiency level enables this design to replace much larger separators. (26pp)

LABO ★ D15 82067 D/45 ★ FR 2479-251
Compsn. for dispersing oil spills on the surface of water - contg. polyethylene glycol or sorbitan ester(s) of fatty acids, glycol ether solvent and calcium or magnesium sulphonate

LABOFINA SA 28.03.80-FR-006924

A97 H03 (02.10.81) C08k-03/32

28.03.80 as 006924 (513AS)

In a method for dispersing oil spills on the surface of water, a dispersing compsn. is applied to the oil comprising (a) a mixt. of surfactants chosen from polyethyleneglycol esters of 12-20C fatty acids or sorbitan esters of these acids, (b) a glycol ether type solvent used alone or mixed with water or a paraffinic solvent and (c) a calcium- or magnesium sulphonate or mixts. of these.

Component (a) is pref. sorbitan monolaurate, the monolaurate of polyethylene glycol with a mol. wt. of 200-600. Ethoxylated tall oil or mixts. if these component, (b) is esp. ethylene glycol monobutylether, diethyleneglycol monobutyl ether or diethylene glycol monoethyl ether. The solvent is used alone or mixed with water or a 10-14C (iso)paraffin.

The compsns. have a cloud point below -10 deg.C, a flash point of above 70 deg.C, a sufficiently low viscosity to enable handling at low temps. and low toxicity w.r.t. marine flora and fauna. They are able to emulsify most types of oil into emulsions having little tendency to reform into layers by coalescence, and do not retard the kinetics of biodegradation of the treated hydrocarbons. (16pp)

ATCM ★ D15 82077 D/45 ★ FR 2479-437
Vapour condenser partic. for solar powered desalination evaporator - has very thin plates alternating with horizontal and vertical corrugations

ATELIERS ET CHANTIE SOC 25.03.80-FR-006590

Q78 (02.10.81) C02f-01/14 F28b-01/02 F28f-03/04

25.03.80 as 006590 (448DH)

The heat exchanger comprises a pair of corrugated plates, each with a thickness of only a few tenth of a mm. The corrugations of both plates are vertical sandwiched between the two vertical corrugation (VC) plates is a third, identical plate with its corrugations disposed horizontally. The plates are connected for vapour to flow between the two VC plates while a cooling liq. is trickled down the outer surfaces of these VC plates.

Sandwich type heat exchanger modules as described above can be combined in a multi-module heat exchanger. Each pair of adjacent modules has an intermediate separator plate identical to the middle plate of each module. The plates can be made of plastics or metal.

Highly efficient heat transfer is achieved which is vital when the temp. difference between vapour and cooling liq. is quite small. The corrugations stiffen the very thin plates. (5pp Dwg.No.1)

Purificn. of waste water contg. organo-mercury cpds. - by electrolysis and adsorption with activated charcoal and/or chelate resin

MITSUBISHI CHEM IND KK 29.02.80-JP-025012

E12 J03 (24.09.81) C02f-01/28

29.02.80 as 025012 (34KB)

A waste water contg. organic Hg cpds. of formula (I) and (II) (where R is 1-8C alkyl, and X is halogen atom), is effectively purified by electrolysis treatment by means of cathode and anode inserted into the water to decrease the content of the organic Hg cpds. down to about 5 ppm of the total Hg concn. and subjecting the treated liquor to absorbing treatment with activated charcoal and/or chelate resin to decrease finally the total Hg concn. downwards of 5 ppm.

Al is used as the anode, and Al, Fe or carbon is used as the cathode. When using Al for both of the electrodes, a film is hardly formed on the surface of the anode and electric current is kept under constant value. The electrolysed water is adjusted to a pH of 6-7 to remove ppte. and the activated charcoal treatment is carried-out at a pH value of 3-6, (pref. 4). (10pp)

 18.02.77 as 016165 (6PW)
 Organic effluent treatment involves (i) trapping fine carbonaceous particles co-existent in a gas generated by the thermal cracking of organic solid, allowing thus collected particles to contact organic effluent to adsorb the organic matter, and (ii) filtering off the fine carbonaceous particles that have adsorbed the organic waste.

Carbonaceous particles which have adsorbed organic matter can be subjected to trouble-free disposal by incineration or land-filling, which eliminates the need for desorption required in the use of conventional adsorbent, providing low-cost treatment. Biological treatment of thus pretreated organic effluent enables the use of more compact aeration tank.

The treatment is esp. effective for the removal of high-molecular organic acids and aldehydes. (J53101849) (7pp)

AGEN D15 92163 A/51 = J8 1042-990
Removing formaldehyde from waste water - by treating with 2-hydrazo-benzothiazole (deriv.)

Processing waste boiler water - by evapn. and mixing with water from sodium cation filter previously, evaporated to ppte. sodium chloride

DON FERR METALEFFL 23.05.78-SU-619081

(17.02.81) C02f-05

23.05.78 as 619081 (815VE)

Waste boiler water such as drain water from steam generators is treated to remove salts by evapn. to 20-30% salt concn. then mixing with waste water from a sodium cation filler, evapd. prior to mixing to give NaCl ppte. and a 35-40% soln. of $CaCl_2$ and $MgCl_2$.

After mixing, a ppte. formed which was filtered off, and the filtrate was neutralised with hydrochloric or sulphuric acid. Compared to the previous method of mixing the liquors prior to evapn., the process permits extraction of twice the amt. of sodium chloride, sepn. of sodium sulphate, and results in a 3-fold redn. in the consumption of reagents. The treated water is free of salts, and causes no problem of contamination when disposed of by burial. Bul. 6/15.2.81 (6pp)

Melting icebergs to produce fresh water - also using warmer surface sea-water, evaporated, and used to operate turbine

US SEC OF AGRICULTURE 11.07.79-US-056652

Q55 (20.10.81) F03g-07/04

11.07.79 as 056652 (295HM)

Fresh water is produced by evapg. warm surface sea water to yield water vapour. Mechanical energy is generated using the vapour which is subsequently condensed by contacting it directly with cold melt water from an iceberg. This produces a mixt. of condensed vapour and melted iceberg water.

The mixt. is contacted with the body of the iceberg to melt it and produce cold melt water. The contact is made so as to produce a turbulent flow of the cold melt water. A portion of the mixt. is used as fresh water produce while the remainder is cycled for direct contact with the vapour.

Used for producing water from an iceberg partic. for irrigation

In arid areas of the world. The amt. of fresh water produced is greater than the amt. of cold water obtd. from melting the iceberg alone. Mechanical energy is also produced. (9pp)

Clarification of slimes - by treatment with stabilised aq. base-magnetic colloid, then dilution

US SEC OF INTERIOR 14.08.80-US-177975
(20.10.81) C02b-09/02
14.08.80 as 177975 (478RH)

Slimes (Fe oxide, oxidised taconite or kaolin slimes, or scrubber H₂O from Fe-making furnaces) are clarified as follows: (a) slime is treated with a stabilised aq. base magnetic colloid consisting of (1) colloidal magnetic particles (I), and (ii) one or more surfactants (II) to bridge (I) electrostatically to the slime particles and to stabilise (I); (b) the magnetic colloid becomes unstable and (I) irreversibly flocculate when the colloid is sufficiently diluted; and (c) the clarified slime is sepd. from the aggregated (I)-slime particle flocules.

In step (a), slime is pref. treated with a 10-15C n-aliphatic amine (esp. dodecylamine) stabilised magnetic colloid (20-30% pref. ca 25% amine by wt. of (I)) in which (I) has particle size 50-100 angstroms. In step (b), colloid is diluted to magnetisation less than 1-3 gauss.

Rapid method allows the use of a much smaller settling tank, and provides for particle-to-particle titration (i.e. using smaller vols. of the magnetic reagent). (6pp)

28.04.80 as 144721 Div.ex 4224157 (513BZ)

Process for sepg. solids from suspensions comprises mixing influent in an inner mixing compartment of a separator unit, the influent being transferred to an outer settling compartment from which clarified liquids and settled suspensions are withdrawn. The mixing compartment is sepd. from the settling compartment with a hydrodynamic changing means which minimises convective momentum of the influent during transfer from the mixing to the settling compartment, which prevents agglomerated solids from breaking up and allows them to settle without interference from the influent. The momentum of the influent flowing through the mixing and settling compartments is continuously decreased to cause solids of increasingly smaller size to settle. Minimisation of the momentum is achieved by directing the influent through perforations in the plate, the perforations being oriented to eliminate or minimise tangential components of velocity and minimise axial components of the velocity so as to minimise the momentum in the settling compartment and to maximise the rate of settling.

Parent specification US 4224157 (73307 C/41) claims an appts for carrying out the process, the appts. also being disclosed in the present specification. (7pp)

Monoclonal antibodies to hepatitis B surface antigen which are secreted by hybridoma cell lines RF-HBs-1, -2 or -4, are new. Diagnosis of hepatitis B surface antigen in a biological samples comprises use of the monoclonal antibodies in immunofluorescent microscopy or immuno-electron microscopy

or in a solid-phase radiometric assay or in an enzyme-linked immunoassay.

Isolation of hepatitis B surface antigen from a biological sample is effected by contacting the sample with the antibodies in the solid phase so that the antigen binds to the antibodies. The antigen is sep'd. from the solid phase.

Kit comprises a first container having a plastics substrate coated with either RF-HBs-1 antibody and one or more other monoclonal antibodies that recognise HBs-Ag, or with RF-HBs-2 and -3 antibodies in it. A second container contains antibody secreted by hybridoma cell line RF-HBs-1 attached to a radioactive or enzyme label. Hybridoma cell lines RF-HBs-1, -2 and -3 are new.

The monoclonal antibodies are useful as an antiviral agent effective against hepatitis B virus. They may also be used in the prevention and diagnosis of hepatitis B virus infections, and for the purification of hepatitis B surface antigen. The 3 antibodies have relative specificities making them esp. useful in the assays and the kit. (40pp)

Detecting blood group antigens in histological samples - by reaction with monospecific antiserum labelled with fluorescent cpd.

FELLAC P 21.04.80-FR-008893

B04 S03 (S05) (28.10.81) G01n-33/80

09.04.81 as 400562 (1251) (F) 11Jnl.Ref E(BE CH DE GB IT LI LU NL SE)

Method for detecting the blood group antigens A,B,O or AB in a histological section comprises treating it with an antiserum monospecific for one of these antigens. The antibodies in this antiserum are labelled, directly or indirectly, with a fluorescent material (F), and the treated section is then washed and examined optically for the presence of (F).

If (F) is present this shows that the antibodies have reacted with the appropriate antigen in the sample. Labelling of the antibodies can be done before or after (e.g. using a labelled anti-immunoglobulin serum) treatment of the section with antiserum. Specified (F) are fluorescein and rhodamine, and their presence is detected under UV light.

Also now are the labelled monospecific antisera.

The antigens are determined easily and reliably without the problems associated with labelling antigens with red corpuscles. Detection of these antigens is useful for the prognostic evaluation of malignant tumours. (11pp)

An installation and a process for the prodn. of a fuel gas by anaerobic fermentation. The installation comprises a digester vessel for the fermentation of a very conc' substrate with a dry solids content above 16 percent. Solid waste materials for fermentation are taken through a chopping machine, sprayed with a liq. substrate having a dry solids content below 10 percent and mechanically distributed into the top of the digester vessel.

The liq. substrate is supplied to the spray point from a reception vessel equipped with a preheating coil. Within the digester vessel, the conc. substrate is held clear of the vessel wall by a lining basket which permits drainage of the substrate throughout the height of the vessel. Fermented residue is mechanically extracted at the base of the digester vessel. Liq. draining from the digester vessel is returned to the liq. substrate reception vessel.

Gas is pref. drawn off from the digester vessel at points throughout its height, as well as from the headspace of the liq. substrate reception vessel. The solid materials feeder pref. passes the chopped material through two, spaced hydraulic seals which isolate the interior of the digester vessel from th3 atmos.S The installation is very robust, continuously operating, has low energy requirements, and is viable for use on most farms. Method of feeding prevents formation of surface crust without resorting to a mechanised crust breaker. The complete process can be automatically controlled. (21pp)

Improving taste and flavour of wine - by adding culture prod. of microbe of *Aspergillus* strain

KIKKOMAN CORP 25.02.80-JP-021714

(24.09.81) C12g-01

25.02.80 as 021714 (5PW)

The method comprises culturing the microbe of *Aspergillus* strain and adding the culture product or its protein fraction which shows hydroxy-cinnamic-tartaric acid-decomposing activity (DACT) and tannic acid-decomposing activity (DATA), to wine during its prepn.

A. Sojoe IAM2678, A. niger IAM3002, A. japonicus IFO4062, ATCC20236, etc. is pref. The cultured prod. is added so that DACT 15-40 U and DATA 100-300 U are combined in 1 litre of grape juice.

Excellent wine, free of astringency can be prepd. even from the press run grape juice contg. large amts. of polyphenol compounds. The yield of wine can be increased. (8pp)

TOYM ★ D16 82363 D/45 ★ J5 6121-484
Heat-stable glycerol kinase prepn. - by cultivating *Cellulomonas* or *Corynebacterium* microorganisms

TOYOBO KK 27.02.80-JP-024557

B04 (24.09.81) C12n-09/12 C12r-01/*

27.02.80 as 024557 (5WB)

Method involves culturing *Cellulomonas* or *Corynebacterium* microorganisms which can produce glycerolkinase (GK), in nutrient medium and recovering GK accumulated.

Prof. *Cellulomonas flavigena* IFO12680, *Corynebacterium xerosis* IFO12684, etc. are used. Cultivation is at 28-35 deg. C and pH 6.0-8.5 for 15-30 hours. To increase yield 10-50 g glycerol per litre of culture medium is added. GK obtd. catalyses the phosphorylation of glycerol in the presence of ATP to form glycerol-3-phosphoric acid and ADP.

KG obtd. is more stable to heat and pH than conventional KG and can be utilised for determining triglyceride in serum in combination with lipoprotein-lipase and glycerol-3-phosphoric acid-dehydrogenase or glycerol-3-phosphoric acid-oxidase. (5pp)

YAMA ★ D16 82364 D/45 ★ J5 6121-488
6-Amino-5-hydroxy-1,3-cyclohexadiene-1 carbaldehyde prepn. - useful as antibiotic, by cultivating *Streptomyces*

YAMANOUCI PHARM KK 25.02.80-JP-022437

B05 (24.09.81) A61k-35/74 C12p-07/24 C12r-01/46

(1.4R.) as 5.02.8 022437

Antibiotic 6-amino-5-hydroxy-1,3-cyclohexadiene-1-carbaldehyde (I) is prepd. by cultivating *Streptomyces* sp. G-706 in a medium and recovering I.

I being useful as a broad spectrum antibiotic substance is prepd. in high yield by cultivating the above strain (FERM-P 5359) in the presence of a metal chelating agent.

Cultivation is performed under aeration at about 18-35 deg. C, pref. about 30 deg. C in pH about 5-10, pref. about 5-7 in the presence of a chelating agent such as ethylenediamine tetraacetate. (6pp)

DAIL ★ D16 82365 D/45 ★ J5 6121-489
Long chain dicarboxylic acid prepn. - by forming fermented broth contg. the acid, heat treating, removing insol. material and crystallising out prod.

DAICEL CHEM IND LTD 28.02.80-JP-024606

E17 (24.09.81) C12p-07/40

28.02.80 as 024606 (5PW)

Long chain dicarboxylic acid (I) is prepd. by fermentation process. Method comprises (a) making (I) in the fermented broth in free acid form, (b) heat-treating the mixt. containing free acid-form (I) and microbial body in organic solvent, (c) sepg. insolubles such as microbial body, organic salt, etc. while the mixture is hot and (d) crystallising out (I) from the obtd. organic solvent soln.

The organic solvent is required (1) not to be completely miscible with water, (2) either to have higher b.pt. than water or to make azeotropic mixture with water and (3) to be able to dissolve LCDA under hot conditions but to be unable to dissolve LCDA at normal temp.. Examples of the organic solvent are aromatic hydrocarbons (e.g. xylene, toluene, cumene, etc.) and aromatic halo-hydrocarbon (e.g. chlorobenzene, dichlorobenzene, chloroxylene, etc.). Usually heat-treatment is at above 100 deg. C for 1-3 hours after dehydration of the mixt. is over.

The microbial body and other insolubles can be removed easily by filtration, etc. and (I) can be obtd. in high yield. (4pp)

Purifying coenzyme/Q - by adsorbing from (hydrous)alkanol extract on adsorbent contg. styrene di:vinyl benzene copolymer

SEKISUI CHEMI IND KK 29.02.80-JP-025583

B05 (24.09.81) C12p-07/66

29.02.80 as 025583 (104AS)

Coenzyme Q of formula (I) (where n is integer 1-12) is purified by adsorbing (I) from lower alkanol or hydrous lower alkanol extract of (I) on porous adsorbent comprising mainly styrene- and divinylbenzene reticular copolymer of ave. pore dia. 300-1000 angstroms and eluting (I).

Disadvantages of known processes including expensive antioxidants such as pyrogallol are overcome. (I) showing excellent pharmacological or biological activity is industrially and effectively purified by simple and inexpensive process with high purity. Suitable lower alkanols include (m)ethanol, and (iso)propanol. Starting extract of (I) is available by extracting animal tissue, mycellia of microorganism or plant with lower alkanol or hydrous lower alkanol. (3pp)

ELED ★ D16 82367 D/45 ★ J5 6121-491
L-Threonine prepn. - by reacting glycine with acetaldehyde in the presence of *Arithrobacter* sp.

DENKI KAGAKU KOGYO CO 25.02.80-JP-021595

B05 E16 (24.09.81) C12p-13/08 C12r-01/06

25.02.80 as 021595 (104AT)

L-Threonine (I) is prepd. by reacting glycine with acetaldehyde in the presence of microorganism *Arithrobacter* DK-1084 or DK-1365 (FERM-P No. 5320 and 5321, respectively).

Reaction may be performed in the presence of one or more of manganese, iron, magnesium, and cobalt ions. Microorganism may be dipped in metal chelating agent e.g. EDTA etc. before using. Reaction mixt. is kept in pH 7-8 at 10-70 (pref. 10-40) deg. C. Disadvantages of prior art processes including low yields of (I) and the ratio of threo and allo forms being less than 1 are overcome by using a new strain. (I) is an essential amino acids and useful as medicinal, food additive or feed additive and is prepd. in higher yields than prior art processes. (10pp)

AJIN ★ D16 82368 D/45 ★ J5 6121-492
L-Phenylalanine prepn. - by aerobic culture or strain of *Brevibacterium* or *Corynebacterium* which requires glutamic acid for growth

AJINOMOTO KK 28.02.80-JP-024519

B05 E14 (24.09.81) C12p-13/22 C12r-01/13

28.02.80 as 024519 (5PW)

Method comprises aerobically culturing bacterial variety which is of strain *Brevibacterium* or *Corynebacterium*, which requires glutamic acid for its growth and can produce L-phenylalanine, in liquid culture medium and recovering L-phenylalanine accumulated. Suitable parent strains are *B. debaricatum* ATCC14020, *B. lactofermentum* ATCC13869, *B. roseum* ATCC13825, *B. saccharolyticum* ATCC14066, *C. acetoacidophilum* ATCC13870, *C. acetoglutamicum* ATCC15806, *C. glutamicum* ATCC13032, etc. used. The varieties can be obtd. by treating those parent strains through common variation-inducing means such as the irradiation of radioactive ray, the treatment with N-methyl-N'-nitroso-N-nitroguanidine, etc. The culture is practised at 20-40 deg. C at pH 5-8. (4pp)

KYOW ★ D16 82370 D/45 ★ J5 6121-495
Analgesic, spasmolytic, sedative benzodiazepine deriv. prepn. - by cultivation of microorganism, esp. *Streptomyces sakayensis*

KYOWA HAKKO KOGYO KK 29.02.80-JP-024927

B02 (24.09.81) C12p-17/18 C12r-01/46

29.02.80 as 024927 (104PW)

Benzodiazepine derivs. of formula (I) (wherein R is H or OCH3) are prepd. by cultivating microorganism having ability to produce at least one of the cpds. in a medium. Specifically *Streptomyces sakayensis* DO-65 (FERM-P5366) or its mutant are cultivated. SEN-215 (I, R is H) is analgesic, sedative or spasmolytic agent. Tonemycin (I, R is OCH3) is useful

antibacterial or antitumoural agent. SEN-215 and tonemycin are found to be cultivated by *Streptomyces sakayensis*. Daily dosage of SEN-215 for intravenous or abdominal admin. is about 0.1-0.5 mg/kg to humans. (7pp)

TOKU ★ D16 82371 D/45 ★ J5 6121-496
Recovering polysaccharide from cultured prod. - by heat-treating cultured prod. under alkaline conditions, filtering and recovering polysaccharide from filtrate

TOKUYAMA SODA KK 26.02.80-JP-022226

(D17) (24.09.81) C12p-19/04 C12r-01/05

26.02.80 as 022226 (5AT)

Method comprises heat-treating the cultured prod. at 80-120 deg.C under alkaline condition of pH 10-13, filtering to remove insolubles and recovering polysaccharide from the filtrate.

Alcaligenes faecalis produces polysaccharides composed of D-glucose, D-galactose, L-fructose and D-glucuronic acid. But the cultured prod. is highly viscous and filtration is difficult by prior art methods. After filtering the polysaccharide can be recovered as usual by adding water soluble organic solvent such as methanol, ethanol, acetone etc. and sepg. formed ppt. by filtration etc.

By heat-treating the cultured prod. under alkaline condition most of microbial body is solubilised and clear soln. can be obtd. by filtering it to remove remaining insolubles. Filtration of viscous cultured prod. can be avoided and polysaccharide can be recovered inexpensively. (5pp)

NISB ★ D16 82372 D/45 ★ J5 6121-497
Polysaccharide prodn. by cultivating microorganism - of genus *Hyphomicrobium* in culture medium contg. methanol, nitrogen source, inorganic salt and other additives

19.09.78 as 115245 (5AS)

Fixed enzyme or fixed microbial body is obtd. by mixing an aq. suspension of enzyme or microbial body with photosetting resin uniformly and irradiating active ray on the mixt. It is formed in globules, cylinders, rings or square pillars so that their thickness satisfies the equation (I) pref. the equation (II).

T is thickness of the resin layer in mm; A is the activity of the dry fixed enzyme or the dry fixed microbial body expressed by activity-International unit/g-dry enzyme or dry microbial body.

The specific activity of the fixed prod. depends on the thickness of the photosetting resin layer. (J55042529) (8pp)

$$T_{mm} \leq e^{-(8.39 \times 10^3)A + 0.35} \text{ mm} + 0.1 \text{ mm} \quad (I)$$

$$0.1 \text{ mm} \leq T_{mm} \leq e^{-(8.39 \times 10^3)A + 0.35} \text{ mm} + 0.1 \text{ mm} \quad (II)$$

19.09.78 as 115246 (5MR)

Fixed enzyme or fixed microbial body are obtd. by homogeneously mixing the aq. suspension of enzyme or microbial body with photosetting resin and irradiating the mixt. Its thickness (mm) can satisfy equation (I)

T lies between 0.1 and $\exp(\exp(-8.39 \times 10^3)A + 0.35) / + 0.1$.

It is so formed in the sieve form that it has opening ratio 3-37% favourably 5-30%. A is the activity of the dry fixed enzyme of the dry fixed microbial body expressed by I, U./g.

The substrate soln. is passed through the equipment with space linear velocity greater than 0.01 cm/sec. The photosetting resin is pref. hydrophilic unsatd. cpd. which has average mol.wt. 300-80000 and acid value 40-200 and contains 2 photo-polymerisable ethylenic unsatd. gps. Enzymes such as urease, glucose-oxidase, glucoamylase, glucose, isomerase, catalase, invertase, lactase, D-aminoacid oxidase, gamma-galactosidase, aminoacylase, aspartase, etc. and the body of the microbes such as *Streptomyces phaeochromogenes*, *Lactobacillus bulgaricus*, *Saccharomycetes cerevisiae*, *Aerobacter aerogenes*, *Bacillus subtilis*, *Corynebacterium glutamicum*, *Trichoderma viride*, etc. can be fixed. Light of 2500-6000 angstroms wavelength is used. The sieve has pores of dia. 0.5-3.0 mm. (J55042530) (9pp)

07.06.75 as 050709 (42TM)

A method for fixing mycelium (I) into a collagen, comprises (1) mixing water-soluble collagen (II) soln. and a suspension of microorganisms (I), which does not decompose collagen; (2) extruding the mixt. as filament from a nozzle into a salt (III) soln. or organic solvent (IV), to solidify the mixt. and (3) hardening the solidified filaments with cross-linking agent (V) having aldehyde radical and/or by irradiation of UV and/or gamma rays.

The amount of (II) should be 500-1000 pts.wt. per 100 pts.wt. of (I) and the concn. of (I) in the mixt. of (I) and (II) should be adjusted to about 4%. The pH of the soln. must be adjusted to a value apart from isoelectric point of (II). Example of (III) and (IV) are ammonium sulphate, Na sulphate, acetone and (m)ethanol. (V) is e.g. dialdehyde starch or glutal aldehyde are listed. (J55000093) (5pp)

SEIS D16 47345 C/27 = J8 1043-355
Fixing of enzymes - by carrying in gel or porous substance prep'd. from citrus fruit

SEISAN KAIHATSU KAGAKU 14.11.78-JP-140804

B04 (12.10.81) *J55068-291 C12n-11/10

14.11.78 as 140804 (5DH)

The method comprises carrying enzyme in gel or porous substance which is prep'd. by (a) treating citrus fruit at pH 1-8, (b) adjusting pH to 10.5-12.5, with alkali for dissolving inner film and/or middle skin, (c) adding water-miscible organic solvent ppte. alkali metal pectinate, (d) gelling the ppte. and opt. (e)

dehydration-drying to moisture content ca. 10% for making porous substance. Enzymes or the microbes including enzyme can be fixed under moderate conditions only. The fixed enzyme can keep its enzyme activity for long period.

The gelatin of alkali metal pectinate can be practised by dissolved it in water to 1-20% soln., and spraying the aq. soln. of polyvalent metal salt on it. (J55068291) (9pp)

TAKG D16 87204 C/49 = J8 1043-356
Immobilisation of enzyme or mycelium - using as substrate neutralised basic aluminium salt

TAKI KAGAKU KK 09.04.79-JP-043493

(12.10.81) *J55135-592 C12n-11/14

09.04.79 as 043493 (42TM)

Enzyme (I) or mycelium (II) is fixed on substrate formed by neutralisation of basic aluminium salt (III). As (III) is easily available in the market, (I) or (II) is fixed inexpensively according to the present method.

A cpd. represented by the formula: $\text{Alm}(\text{OH})_n\text{X}_{3m-n}/p$ (X = anion; p = valence of X; m and n are exponential factor; 3 m greater than n) is used as (III).

Typical X are Cl, NO₃, SO₄, etc. Alkalinity, $(n/3m \times 100)$ is usually 30-85%. Typical (III) are basic aluminium chloride, basic aluminium nitrate, basic aluminium sulphate, etc. A part of Al in the formula may be subst'd. by Fe. For the immobilisation of (I) or (II), a soln. contg. (III), and (I) or (II) is neutralised, or (I) or (II) is mixed with the prod. formed by neutralisation of (III). After formation of the gelatinised prod. contg. (I) or (II), it is sepd. from the soln. and vacuum-dried. (III) should be neutralised until pH of the soln. reaches 5-8. (J55135592) (3pp)

Quantitative or qualitative determ. of amino acid - involves converting one optically-active isomer to another using amino acid-racemase and oxidn.

MATSUSHITA ELEC IND KK 14.12.78-JP-155633

B05 (12.10.81) *J55081-595 C12n-11/18 C12q-01/26 G01n-27/40 14.12.78 as 155633 (5BZ)

The method for analysing, amino acids quantitatively or qualitatively involves converting L-(or D-) amino acid to D-(or L-) amino acid with amino acid-racemase; oxidising the converted D-(or L-) amino acid with D-(or L-) amino-oxidase; and measuring the change during oxidn. By this method specific amino acid in the substance contg. various amino acids can be selectively analysed.

As amino acid-racemase alanine-racemase, methionine-racemase, glutamate-racemase, proline-racemase, lysine-racemase, threonine-racemase, etc. can be used. Amino acid-racemase and D-(or L-) amino acid-oxidase are pref. used in the form of fixed enzyme. For the object the change during oxidn. is measured. The decrease in oxygen concn. the increase in hydrogen peroxide concn., the decrease in redox cpd. (oxidised form) concn. or the increase in redox cpd. (reduced form) concn. can be used as the indicator, and they can be easily measured electrically or colourimetrically. (J55081595) (5pp)

FUJC D16 66304 W/40 = J8 1043-718
Basic antibiotic purification - by adsorption on an aqueous magnesium aluminosilicate suspension and selectively eluting

FUJICHEMICAL IND KK 12.09.73-JP-103537

B04 (14.10.81) *J50052-286 + C12p-01 12.09.73 as 103537 (HM)

Basic antibiotic is adsorbed on particles of Mg aluminosilicate (I) suspended in water, diluted neutral buffer, or salt soln. and selectively eluted by raising salt concn. or pH.

In an example, a lytic enzyme against yellow *Micrococcus* and Streptomycin (II) produced by *Streptomyces griseus* A-18 was sepd. The microbe was cultured on a medium (pH 7.2) contg. soybean cake extract 7.5, soluble starch 2, and yeast extract 0.5%, plus minor minerals at 30 deg.C for 3 days. The culture filtrate (500 ml) was diluted to 1 l and separated on a column of (I). The lytic enzyme and (II) adsorbed were eluted with NaCl; (II) was eluted first with a yield of 96% and the lytic enzyme was eluted with a yield of 75%. (II) was adsorbed on an active C, eluted with a mixt. of MeOH and HCl (100:0.5 l), concd., and purified by sephadex G-10. Yield was 85%. (J50052286) (5pp)

Mfg. package contg. lyophilised immunological reagents - by mixing reagents above freezing point, passing to cold vessel and lyophilising

AMERICAN HOME PROD CORP 17.03.80-US-130927
B04 Q76 (20.10.81) F26b-05/06
17.03.80 as 130927 (1248AS)

Prepn. of a package contg. a mass of dry material (I) comprising at least 2 immunologic reagents that are incompatible with each other in the presence of moisture involves first prepg. aq. liquid compsns. of each reagent. Then cooling each compsn. to a temp. slightly above its f.pt. and mixing the compsns. Finally charging the mixt. at slightly above the f.pt. into a container at below the f.pt. of the mixt. so that it freezes and then lyophilising it.

The procedure is simple and quick, and the packages are in a convenient form for use in immunoassays etc., esp. for pregnancy determ. with the reagents described in US 4123343. (4pp)

Prepn. of pyruvate-free xanthan-contg. fermentation broth suitable for the prepn. of mobility control solns. used in oil recovery comprises, (a) aerobically fermenting a pyruvate free xanthan producing strain of *Xanthomonas campestris* in an aq. nutrient medium whose ingredients comprise a carbohydrate, a source of assimilable N and trace elements; and (b) continuing the fermentation until at least about 100 ppm. of pyruvate-free xanthan is present in the broth.

Pref. the strain is *Xanthomonas campestris* ATCC 31313. Sufficient shear is provided to cause adequate dispersion of the polysaccharide and prevention of clump formation. (6pp)

MERI ★ D16 83481 D/45 ★ US 4296-204
Cell culture propagation for vaccine prodn. - in system with motionless mixer element with cells attached to surfaces

MERCK & CO INC 07.07.80-US-166641 (25.01.78-US-872289)

B04 C03 (20.10.81) C12m-07

07.07.80 as 166641 (1248BZ)

Propagation of cells is effected by attaching the cells to the surfaces of a motionless mixer element disposed within a housing. The element comprises an assembly of parallel sheets shaped to provide channels that converge and diverge to form mixing cells. Each cell is formed and bounded by the juncture of 2 inlet channels that converge towards each other at about right angles in one plane and 2 outlet channels that diverge from each other at right angles in another plane, the planes being rotated through a right angle relative to each other.

Nutrients are supplied to the mixer and the cells are maintained under conditions permitting cell growth and division, then the cells are harvested.

With the method, and approp. appts., tissue culture propagation for high prodn. of cells and vaccines is conveniently effected, and uniform liquid flow across all growth surfaces is achieved. Uniform mixing is possible regardless of flow rate or equipment dimensions, and large scale appts. works as well as small scale appts. The method is esp. useful for replication of a virus by using virus-infected cells. (5pp)

VERM/ ★ D16 83482 D/45 ★ US 4296-205
Continuous dialysis flask for long term cell culture - with separate culturing and dialysis chambers separated by dialysis membrane

VERMADS 22.02.80-US-123552

(20.10.81) C12m-03/04 C12n-05

22.02.80 as 123552 (295BZ)

A flask for cell growth comprises a tissue culture chamber, a dialysis chamber, and a dialysis or millipore membrane sepg. the chambers. The tissue culture chamber is divided into a tissue culture compartment and a dialysis compartment by a tissue culture shelf which has perforations with upraised edges. These form tray-like areas so that cells cultured on the shelf so not pass over the edges and through the perforations.

Used for the prepn. of conditioned media from tissues or various cell populations, or for the long term in vitro growth and maintenance of cells. The shelf provides a compatible surface for the establishment of a feeder layer of cells, essential for the long term maintenance of haemopoietic stem cells. (6pp)

Anaerobic fermentation plant - produces methane and agricultural fertiliser from controlled mixt. of dry and liq. organic substrates

DEDENON J M 21.04.80-FR-008855

(20.10.81) *EP--38-759 C12m-01

17.04.81 as F00053 (448BZ) (F) FR-898669 FR-914808 FR1011722 BE-507640 N(AU BR DK HU JP NO SU US)

An installation and a process for the prodn. of a fuel gas by anaerobic fermentation. The installation comprises a digester vessel for the fermentation of a very conc. substrate with a dry solids content above 16%. Solid waste materials for fermentation are taken through a chopping machine, sprayed with a liq. substrate having a dry solids content below 10% and mechanically distributed into the top of the digester vessel.

The liq. substrate is supplied to the spray point from a reception vessel equipped with a preheating coil. Within the digester vessel, the conc. substrate is held clear of the vessel wall by a lining basket which permits drainage of the substrate throughout the height of the vessel. Fermented residue is mechanically extracted at the base of the digester vessel. Liq. draining from the digester vessel is returned to the liq. substrate reception vessel.

Gas is pref. drawn off from the digester vessel at points throughout its height, as well as from the headspace of the liq. substrate reception vessel. The solid materials feeder pref. passes the chopped material through two, spaced hydraulic seals which isolate the interior of the digester vessel from the atmos.

The installation is very robust, continuously operating has low energy requirements and is viable for use on most farms. Method of feeding prevents formation of surface crust without resorting to a mechanised crust breaker. The complete process can be automatically controlled. (21pp)

Sole leather prodn. - includes oiling, neutralisation and filling in one stage using urotropin and urea and, for tanning, titanium cpd.

LEATHER SHOE IND 21.11.78-SU-887434

(07.11.80) C14c-03/08

21.11.78 as 887434 (70VE)

Leather for soles is produced by tanning a hide or a chromated intermediate product with a titanium cpd., neutralising additionally tanning, filling and oiling. This process is intensified by simultaneously carrying out the oiling, neutralisation and filling using the spent bath from the tanning. The liquid coefft. is 0.5-0.6. For the oiling, an acid-resistant fat emulsion is used. For the neutralisation and filling, urotropine and urea are used. The consumption of urotropine is pref. 4.5-6 and urea 9-12% w.r.t. the hide.

Urea-formaldehyde cpds. which are formed by reaction with H₂SO₄ in the spent tanning bath, act as fillers. The oiling-neutralising-filling stage lasts 4-6 hr. (conventional 12-18 hr.). Bul.41/7.11.80 (2pp)

Compsn. for whitening the skin - obtd. by combining aq. dispersion obtd. from ribosome formed from lipid contg. ascorbic acid and vitamin(s) in water

KANEBO KESHO-HIN KK 27.02.80-JP-024673

E19 (22.09.81) A61k-07

27.02.80 as 024673 (5KB)

Cosmetics are the liquid or pasty cosmetics prepd. by combining the aq. dispersion which is obtd. by dispersing the ribosome formed from the lamellar phase composed of the cpd. lipid including ascorbic acid, its derivs. and vitamins in water.

As ascorbic acid ascorbic acid, its salt and its ester can be used in an amt. of above 0.001 w/w% based on the cosmetic. As vitamin, vitamin E such as alpha-tocopherol, tocopherol acetate and tocopherol nicotinate can be used in an amt. of below 67 w/w% in lamellar phase. As cpd. lipid, phospholipid (e.g. lecithin, kephalin, etc.) and synthetic phospholipid (e.g. dipalmitoyl-lecithin, etc.) can be used. (5pp)

KAOS ★ D21 82209 D/45 ★ J5 6120-613
Compsn. for pretreating hair prior to shampooing - contains polymer having cyclic cationic gp. and opt. peptide

KAOS SOAP KK 26.02.80-JP-023151

A96 (22.09.81) A61k-07/06 C11d-03/37

26.02.80 as 023151 (5PW)

Compsn. contains (a) 0.1-5 wt.% of polymer having cyclic cationic group and opt. (b) 0.1-5 wt.% peptide of mol wt. 300-10000 (600-1500) in a wt ratio 10-1/50:1.

The polymer having cyclic cationic group is pref. homo-polymer or copolymer of diallyl quat. ammonium cpd. and vinylpyridine cationic polymer.

Compsn. shows excellent hair-protecting effect, hair-conditioning effect and emollient effect without causing sticky touch to hair. By adding the peptide (b) the above effects can be further increased. (4pp)

LIOY ★ D21 82214 D/45 ★ J5 6120-614
Prod'n. of substance for treating wounds, burns etc. - by solvent extracting Aloe arborescens mill var. natalensis, removing PPTE. and chromatographing extract on active carbon

LION DENTIFRICE KK 26.02.80-JP-023071

B04 (22.09.81) A61k-35/78

26.02.80 as 023071 (33WB)

In the prodn. of the substance from sap or extract of Aloe arborescens mill var. natalensis, the improvement comprise extracting Aloe arborescens mill var. natalensis with water miscible solvent, removing the resultant precipitate and chromatographing the extract on a column of active carbon.

Pref. the sap or extract obtd. by pressing or crushing extracted with a 3-4 fold amt. of water-miscible solvent (e.g. methanol, ethanol, isopropanol, acetone) for 12-24 hours. After removal of the resultant precipitate, the extract is chromatographed on a column of active carbon with water. Pref. the extract has a concn. of 0.5-10 w/w%. The active carbon is used in amt. 10-20 fold the amt. (by wt.) of the active fraction.

The substance can be used as a medicine for external use in treatment of wounds, chaps, cracks, or burns. Also, it can be incorporated into cosmetics or beverages. The substance can be easily formulated, for example, into ointments or lotions. The LD50 value in rats is at least 10000 mg/kg (p.o.). The present process gives the desired substance in high yield relatively simply. (6pp)

Shampoo compsn. - includes at least one polyethylene oxide, sodium polyacrylate and polyacrylamide

JOHNSON KK 04.03.80-JP-026184

A96 (26.09.81) A61k-07/06 C11d-03/37

04.03.80 as 026184 (126PW)

A shampoo compsn. contains at least one of polyethylene oxide, sodium polyacrylate, and polyacrylamide, pref. in amt. of 0.0001-3.0 wt. %.

The quality of foams produced by the shampoo is improved. The foams are creamy because of the imparted consistency and lubricity. The strength of the foam film is also improved and stability is increased. Therefore friction between hairs is moderated and the damage of the hair due to the friction is reduced.

Typical cpds. comprises 0.003 pts.wt. polyethylene oxide, 7 pts.wt. salt of lauryl ether sulphate, 2 pts.wt. coconut oil fatty acid diethanolamide, 3 pts.wt. propylene glycol, 0.5 pts.wt. perfume and balance purified water to produce 100pts. wt. compsn. (2pp)

LIOY ★ D21 82782 D/45 ★ J5 6123-910
Foamable dentifrice paste - comprising alcohol sulphate ester or its salt mixed with acyl-amino acid or its salt and dextranase

LION DENTIFRICE KK 05.03.80-JP-027549

E19 (29.09.81) A61k-07/28

05.03.80 as 027549 (15KB)

Dentifrice compsn. comprises a homogeneous blend in which a higher alcohol-sulphate-ester or its salt is mixed with N-long chain-acyl amino acid or its salt in a mixing wt. ratio of 1/2 to 2/1 and the mixt. is blended with dextranase. The N-long chain-acyl amino acid or its salt occupies 0.2-0.5 wt. % of the total dentifrice compsn. and 20-150 wt. % of a nonionic activator is blended with 100 wt. % of the higher alcohol-sulphate-ester or its salt and N-long chain-acyl amino acid or its salt. The higher alcohol sulphate ester or its salt is lauryl-sodium sulphate and the N-long chain acyl amino acid or its salt is sodium deriv. of lauroyl-sarcosine.

A specific paste dentifrice compsn. comprises calcium sec. phosphate (50.0 wt. %) mixed with sorbitol (20.0 wt. %), lauryl-sodium-sulphate (0.7 wt. %), sodium deriv. of Lauroyl-sarcosine (0.5 wt. %) lauric acid-diethanolamide (1.2 wt. %) carraggenan (1.0 wt. %) sodium salt of saccharic acid (0.1 wt. %) perfume agent (1.0 wt. %), dextranase (2000 microgram to the dentifrice) and water.

The paste dentifrice compsn. has good foaming properties nature. (6pp)

TOKA- D21 85334 B/47 = J8 1042-942
Rubber stopper used to measure length on root canal in dentistry - prepd. by vulcanising mixt. of silicone rubber, vulcanised rubber and bismuth trioxide

TOYO KAGAKU KENKYUS 10.04.78-JP-041899

A96 P32 (A26 A60) (08.10.81) *J54133-794 A61c-05/02 A61c-19/04

10.04.78 as 041899 (2NS)

A rubber stopper used in dental treatment consists of rubber obtd. by mixing silicone rubber and vulcanised rubber with bismuth trioxide (Bi₂O₃), and vulcanising the mixt. For example, the compsn. of the rubber consists of 100 pts. wt. of silicone rubber and 10 pts. wt. of Bi₂O₃.

The rubber stopper is used for treating the root canal and is mounted on a reamer for this purpose. The rubber stopper is non-toxic and visible on an X-ray film. Thus the length of the root canal can be easily measured by using the reamer with the stopper. The rubber stopper is easily sterilised and it can be easily cut into a desired shape. (J54133794) (2pp)

MERE D21 90645 X/49 = J8 1043-068
Nacreous pigments based on mica - coated with alternate layers of rutile and tin oxide

MERCK PATENT GMBH 22.05.75-DE-522572

A60 E32 G01 + P78 (G02) (08.10.81) *BE-842-130 C09c-01/36 17.09.75 as 113113 (MR)

Nacreous pigments comprise mica flakes coated with alternate layers of rutile and SnO₂ and included at least the sequence rutile/SnO₂/rutile. The pigments can be used in automobile lacquers, cosmetics and plastics. They have better light and weather fastness than similar pigments containing anatase, and give

strong interference colours. (J51143027) (9pp)

MERE D21 55907 Y/32 = J8 1043-069
Free flowing pearly pigment powder for cosmetics - where the pigment particles are coated with polymers

MERCK PATENT GMBH 29.01.76-DE-603211

A96 G01 (A14 A97) (08.10.81) *DE2603-211 A61k-07 C09c-03/10 26.01.77 as 007616 (004TM)

Prepn comprises individual particles of a flaky pearly pigment (including bismuth oxide-chloride pigments, cyanuric, TiO₂, Al₂O₃), covered by pref 2-25% of a solid polymer (pref polyvinyl pyrrolidone).

Used in cosmetic prepn. The shine and luminosity are less sensitive to mechanical stress than other pigment prepn. The prep is a free-flowing powder. (J52093440) (6pp)

SAUE D21 76135 Y/43 = J8 1043-070
Soluble collagen prodn. for use in cosmetics - from placental extraction residues

SAUERBRUCH BOTTGER KG (BOTT) 17.04.76-DE-616939

A11 (08.10.81) *DE2616-939 + A61k-07/48 C09h-03 16.06.76 as 070921 (367MR)

Placental extraction residues constitute a readily available staring material which is relatively free of impurities and is normally discarded as useless.

The soluble collagen is pref obtd by washing the placental residue with a dil buffered NaCl soln at 0-3 deg C and then extracted with a more conc. neutral salt (esp NaCl) soln for 2-6 days. The extract is then treated with NaCl to salt out the collagen. The residue remaining after extraction can be further extracted with citrate buffer at 0-3 deg C for 1-4 days to isolate acid-soluble collagen, which is out as above.

The collagen product is pref dissolved in a buffer soln. with a pH less than 7 (esp a placental extract) contg a preservative, to produce a storage stable skin-care product. (J52128400) (4pp)

ARAI/ D21 75280 Y/42 = J8 1043-080
Toiletries, e.g. soap, contg. freeze dried egg powder - which imparts properties of raw egg without gelatinous character

ARAI K 08.03.76-JP-024120

(08.10.81) *J52108-407 C11d-03/38 + C11d-09/40 08.03.76 as 024120 (58JB)

Granular egg powder obtd by freeze drying has the activity of raw egg but lacks the gelatinous nature. When combined to form toiletries, uniform compsns may be obtd. When contained in a soap, after washing, a film of nucin is left on the skin. (J52108407) (3pp)

OREA D21 04114 A/03 = J8 1043-260
(N)-Mesylaminoalkyl amino alkyl phenols - used as colour couplers in oxidn. hair dyeing compsns.

L'OREAL SA 09.09.76-FR-027125

E24 (12.10.81) *BE-856-628 + C09b-53 09.09.77 as 108006 (597TM)

Mesylanimo alkylamino alkyl phenols have formula (I): (where R1 is 1-4C alkyl R2 is H or 1-4C alkyl and n is 2 or 3). The cpds. are used as couplers in dyeing compositions for keratinous fibres.

The compsns. are used as couplers with at least 1 oxidn. base, partic. in hair dyeing compsns. The cpds. provide a new range of couplers giving interesting dyeing results, the dyes being light and weather stable and the cpds. innocuous.

The cpds. are prepd. by reacting the aminophenol cpd. with a bromoalkylamine, followed by hydrolysis to form the O,N,N' trimesyl cpd., followed by hydrolysis to remove two mesyl gps. (J53033223) (12pp)

NH-(CH₂)_n-N(R₂)-SO₂CH₃ (I)

SHIS D21 44987 B/24 = J8 1043-264
Hydrophobic powder prodn. for use in cosmetics, plastics etc. - by grinding mixt. of e.g. mica and metal hydroxide then forming crosslinked polysiloxane coating on powder

SHISEIDO KK 12.10.77-JP-122214

A60 G01 H07 (12.10.81) *J54056-083 + C09c-03/12 12.10.77 as 122214 (96AT)

Process is effected by grinding mixt. consisting of particles of mica, kaolin, talc, iron oxide, titanium dioxide, mica covered with titanium, silicic acid, ultramarine, prussian blue and/or zinc oxide and metal hydroxide(s) and allowing methylhydrogenpolysiloxane oil to crosslink and polymerise on the surface of the powders.

The hydrophobic power may be used in cosmetics, plastics magnetic recording tapes, paints, inks, lubricants, etc.

In an example, 97.2 pts. of mica powders were ground with

pts. of zinc hydroxide in vibration ball mill for 10 min., and added 2.8 parts of methylhydrogenpolysiloxane oil of SiH equivalent 77 and ground at ordinary temp. for 30 min. The resulting mica powders were odourless and exhibited strong hydrophobic properties. (J54056083) (8pp)

SNKM D21 75605 B/42 = J8 1043-377
Cast alloys with low m.pt. for mfg. dental prostheses - contg. nickel, chromium, copper, manganese, and germanium, and requiring only simple melting and casting plant

SANKIN IND CO LTD 05.04.78-JP-040698

25.03.80 as 133706 (945WB)

Dentifrice toothpaste or gel contains a normally water-insol. polishing agent, up to 89.5 wt.% water and, as sole essential humectant and gelling agent, a water absorbent anionic polyelectrolyte polymer.

The polymer is a polyacrylic acid ionically complexed with a polyvalent metal cation (Al, Zr, Fe or Zn) at pH 2.0-8.5. At least 90% of the polymer particles have particle size larger than 2 microns and the compsn. contains 0.5-20 wt.% of the polymer. Additional humectant and/or gelling agent may be present to provide rheological modification.

The compsn. has viscosity 50,000-420,000 cPs so that it is not liq. or runny but is not difficult to extrude. (7pp)

Storing two ingredients of dental amalgam - in legs of tube folded at mid point to form V/shape

KENOVA AB 23.04.80-SE-003067

Q31 Q34 (29.10.81) B65b-29/10 B65d-81/32

23.04.81 as SE0120 (295BZ) (E) US3478871 US4023675 N(AU CH)

A length of flexible tubing is folded about a transverse line at its mid-point, and the two legs are bent so that the tube assumes a V shape. A first ingredient of a dental amalgam is placed in one leg of the tube and the second ingredient is placed in the other leg. The fold line at the centre of the tube maintains the two ingredients apart until the amalgam is required. The outer ends of the legs are sealed.

The amalgam is prepared for use by straightening the tube to release the fold, and then shaking the tube axially to mix the ingredients.

The mercury ingredient remains sealed from the atmos. both during storage and preparation of the amalgam. The transverse lateral seal produces no debris when the tube is straightened prior to mixing the amalgam. (17pp)

Non-woven web, for baby napkins - has controlled fusion bonding, to improve tactile properties and wet strength

SCOTT PAPER CO 20.06.80-US-161270

F04 (16.10.81) D04h

19.06.81 as 889315 (1359AT)

A non-woven web, for use in babies' disposable napkins, contains predominantly thermoplastic fibres, and is pre-heated by e.g. infrared rays on one side only before passing between nip rollers for bonding. One roller is of metal and patterned, and is heated more than the other roller, which is smooth and resilient. The side of the web away from the pre-heating device is presented to the patterned roller, which is capable of fusion bonding the thermoplastic fibres. Autogenous fusion bonding occurs, which only partially penetrates the web thickness to the pre-heated side, where most of the bonds are effected by fibre sticking, as distinct from melting.

The thickness of fusion bonds is controlled so that the tactile properties of the pre-heated side of the web are not unfavorably changed. A consistent coherence is promoted in the web, and the wet strength is improved in comparison with known prods. (27pp)

KAOS ★ D22 81686 D/45 ★ BE-889-316
Absorbent article, e.g. sanitary towel - has upper absorbent layer with specified density in wet or dry state under load, and lower absorbent layer contg. water absorbent polymer

KAO SOAP KK 23.06.80-JP-084995

Scleroprotein e.g. collagen, keratin or elastin transplants prodn. -
involving treatment with glycerol or polyethylene glycol to
improve biological stability

BRAUN MELSUNGEN AG 12.04.80-DE-014123
A96 B04 P32 (29.10.81) A61f-01 A61k-37/12

12.04.80 as 014123 (280MR)

In a new procedure for the prodn. of scleroprotein transplants with improved biological stability from raw human or animal scleroprotein by treating with water, treating with hydrogen peroxide, defatting, washing and sterilising, the scleroprotein is treated with glycerol or polyethylene glycol after washing but before drying.

The glycerol or polyethylene glycol treatment gives improved resistance to biological degradation. The transplants are soft, and do not require rehydration before use. The prod. is transparent so that e.g. in brain operations the biological fluids and brain can be viewed through the transplantate.

The glycerol or polyethylene glycol (pref. molecular weight 400-2000) is pref. used in the form of an aqueous 5-50% solution. When the scleroprotein is human dura, it is particularly advantageous to use a 20-40% (esp. 30%) soln. of glycerol in water. (10pp)

A sealed aseptic container with a sealed connecting passage terminating in a coupling box of which part of the wall is opaque, thermoplastic material and the remainder is transparent. The box engages a matched coupling box so that the opaque thermoplastic panels of the two boxes are in face-to-face contact.

The connected boxes are exposed to radiant energy, partic. infra-red radiation, which fuses together the thermoplastic panels and simultaneously opens a passage between the two boxes. The connecting passage is still closed by a diaphragm at the container end of the passage. A needle inside the passage can be manipulated from the exterior to perforate the diaphragm and establish communication between the container and the coupling boxes passage.

The outer coupling box is pref. attached to a sterile pouch in which the contents of the container mix with a liq. ready for administration, e.g. by intravenous injection to a patient. Used for sterile mixing of additive, e.g. antibiotics, for branch injection into a parenteral infusion line. Perfectly sterile mixing is achieved in a pouch which can be retained and ready for instant use intravenous transfusions, esp. during surgical operations. (20pp)

INTE-★ D22 81872 D/45 ★EP --38-416
Disinfectants with improved potency and spectrum of activity - contg. microbiocidal agents in combination with bipolar solvent systems

INTERMEDICAT GMBH 11.03.80-CH-001882
C03 (28.10.81) A01n-25/02
07.03.81 as 101680 (280JB) (G) No-Citns. E(AT BE DE FR GB IT LU NL SE)

New disinfectants contain a combination of microbiocidal substances and bipolar solvent systems. Combination of microbiocidal systems with bipolar solvent systems gives a broader spectrum of activity at lower active substance concns because the water-film necessary for microbiocidal substance is maintained by the bipolar solvent system.

Pref bipolar solvent systems are those having a low vapour pressure and low evapn. The bipolar solvent systems display water-retaining capacity in order to retard drying out of the surface undergoing disinfection.

Bipolar solvent systems are substances and mixt displaying solubility in both plar and non-plar media. They include aldehydes, ketones, alcohols, ethers, carboxylic acids, esters, polyglycols, nitriles, thio cpds and nitrogen cpds.

Typical microbiocidal cpds include glutaraldehyde, isopropanol, 2-bromo-2-nitro-1,3-propanediol, n-dodecylamine, dedecyldimethyl benzylammonium chloride, dodecylbis(aminaethyl)-glycine, alkali hypochlorites and phenol. (18pp)

A water-dispersible concentrate comprises (a) a1-iodo substd. of mol. wt. alkyne urethane of the formula (I),

(ICG(R'2)n-O-C(O)-N(H)-)mR (I)
(b) a substantially water-immiscible organic solvent, and (c) an anionic or non-ionic surfactant of HLB 10-17.1. R is opt. substd. 20C alkyl, aryl or alkanyl, having one to three linkages corresponding to m, each R' is independently H or 1-6C alkyl, a m and n are each 1-3.

(I) may be prepd. by reacting suitable 1-iodo-alkynes carrying hydroxy gp. (themselves prepd. by iodinating appropriate acetylenic alcohols) with appropriate isocyanates. Alternative iodination can follow carbamate formation.

The concentrate is used as a fungicide in water-base coatings

function well as fungicides not only during storage but also after application to surfaces in point. (9pp)

TAISHO ★ D22 82310 D/45 ★ J5 6120-778
Adhesive plaster obtd. by blending rubber base - with magnesium metasilicate aluminate, has excellent storage stability
TAISHO PHARMACEUTICAL KK 27.02.80-JP-023508
A96 E33 G03 (22.09.81) A61k-47 C09J-03/12
27.02.80 as 023508 (136NS)
Adhesive plaster is prepd. by blending (1) magnesium metasilicate aluminate with (2) rubber base. Pref. (2) is a tacky elastomer produced by blending ageing inhibitor, filler, tackifier and softening agent with natural or synthetic rubber. Pref. plaster is produced by kneading the rubber base with an antiphlogistic and anodyne Ce methyl silicate, glycol silicyle, menthol, and coating cloth with the tacky plaster. The amt. of (1) added is pref. 1-20 (5-10) wt.% of the chemical component and 0.2- (1-3) wt.% of plaster.
The adhesive plaster has excellent adherence to and affinity for the skin of human body, rich flexibility and leaves no residue when released from the skin. The plaster has excellent temp. change-resistance. (3pp)

KOSH- ★ D22 82352 D/45 ★ J5 6121-414
Timber preservation - by forming emulsion of oil soluble organic preservative, diluting with water and injecting into timber
KOSHII PRESERVING K 29.02.80-JP-025935

04.03.80 as 027489 (15MR)

Fungicide comprises a homogeneous blend of at least one of anhydrous acetic acid sorbic acid or their salts mixed with a trimethyl surfactant RN(+) (CH₃)₃X(-) or benzyl surfactant (I) where R is alkyl and X is halogen.

The trimethyl type cationic surfactant is pref. dodecyl-trimethyl-ammonium-chloride, hexadecyl-trimethyl ammonium-chloride or octadecyl-trimethyl-ammonium-chloride where R has 8-20C. The benzyl cationic surfactant is pref. tetradecyl-dimethyl -benzyl-ammonium-chloride or octadecyl dimethyl-benzyl-ammonium-chloride. The anhydrous acetic acid and sorbic acid or their salts are pref. 90-99.99 wt.% of total compsn.

The fungicide is used as additive for sterilising corns, seeds, vegetable or fruits. (3pp)

EART- ★ D22 82781 D/45 ★ J5 6123-907
Fungicidal compsn. - of benzimidazole deriv. and 4-chlorophenyl-3' iodo-propargyl-formal

EARTH SEIYAKU KK 05.03.80-JP-028329
A97 C03 E19 (29.09.81) A01n-31/14 A01n-43/78
05.03.80 as 028329 (15BZ)

The fungicidal compsn. comprises a homogeneous blend in which a benzimidazole deriv. of formula (I) is mixed with a cpd. of 4-chlorophenyl-3' iodo-propargylformal of formula (II) and the resulting mixt. as an effective component is mixed with other additive(s). The fungicidal compsn. is used as a conventional chemical agent involving a liq. agent, an emulsion agent, a hydrating agent or an aerosol agent.

The solvent, is chosen from water, alicyclic hydrocarbon such as kerosene, aromatic hydrocarbon, chlorinated hydrocarbon ketones, esters and alcohols. A pulverised solid for prepg. the hydrating agent is chosen from soyabean powders, sawdust diatomaceous earth, mica powders, talc powders, kaolinite powders or dolomite powders. The surfactant for prepg. the emulsion agent is chosen from the anionic surfactant such as (alpha)-olefine-sulphonate salt, alkyl-ether-sulphate ester salt, etc. the nonionic surfactant such as polyoxy-ethylene alkyl-ether, sorbitan-fatty acid-ester or polyoxy-ethylene-alkyl amin or a cationic surfactant is chosen from tetraalkyl-ammonium salt or trialkylbenzyl-ammonium salt.

The fungicidal compsn. is used for coating on or impregnating housing material, furniture, ceiling of house, industrial prods., wood or leather. (5pp)

Prod'n. of triazine derivs. of formula (I) comprises reacting an iminium salt of formula (II) $\text{RA-C(X)=N(+)R5R6 Y(-)}$ with an amidine of formula (III) R1-C(NH2)=N.CN . In the formulae (R1 and R2 are each H, halo, alkoxycarbonyl, opt. subst'd. alkyl, aryl or heteroaryl, amino subst'd. by 1 or 2 alkyl, by 1 aryl or by 1 alkyl and 1 aryl, or are alkylthio, arylthio, alkoxy or aryloxy, but cannot both be halo. R3 is halo, N-heteroaryl, or subst'd. amino as for R1. R4 is H, halo, alkoxycarbonyl, opt. subst'd. alkyl, aryl or heteroaryl, alkylthio, arylthio, alkoxy or aryloxy. R5 and R6 are H, alkyl or aryl (but not both H), or together they complete a sat'd. heterocycle. X is halo. Y is an anion). The reaction is pref. carried out in acetonitrile, benzene, chloroform, methylene dichloride or excess POCl_3 . Reaction is generally at 0 to 100 deg.C. and (I) is recovered by pptn. with water or by extraction. Pref. (II) are formed in situ by reacting the amide R4.CO.NR5R6 or dithiocarbamate R'4'.CS.NR5R6 (R'4' is alkylthio) with an acid halide, pref. POCl_3 , POCl_5 or COCl_2 ,. Specifically with the excess POCl_3 being used as solvent.

Some (I) inhibit the germination of fungus spores. Triazines generally are useful as plastics intermediates, herbicides, disinfectants, algicides, pharmaceuticals and explosives. The process is applicable to a wide range of triazines (including new cpds.) uses relatively mild conditions and readily available starting materials, and generally gives high yields (up to 90%). 27.02.80 as 022842 (33GW)

Organic cpds having ethylenic unsatd. bonds are prepd. by hydrogenolysis of organic cpds having one or more acetylenic unsatd. bonds in the presence of a palladium catalyst. Hydrogenolysis is carried out in the presence of a sulphide cpd. of formula: R-S-(CR₂R₃)_n-OH where R₁ is 1-8C alkyl, R₂ and R₃ are each hydrogen or 1-6C alkyl, and n is an integer of 1-6.

The process gives selectively ethylenic cpds. in good yield with high purity. The ethylene cpds. thus obtd. are useful as pharmaceuticals, perfumes or their intermediates.

Hydrogenolysis is effected with or without a solvent at room temp., under heating or under cooling. Examples of the sulphide cpds. are 2-hydroxyethyl methyl sulphide, 3-hydroxypropyl methyl sulphide, 2-hydroxyethyl ethyl sulphide and 2-hydroxyethyl isobutyl sulphide. The sulphide cpd. is added in amt. 0.01-200 w/w% to a palladium catalyst. The catalyst includes Pd-calcium carbonate, Pd-barium sulphate, Pd-active carbon, or Pd-metal (e.g. Pb, Sn, Zn, Bi, Cu)-carrier (e.g. calcium carbonate, calcium sulphate, barium sulphate). Suitable solvents can be benzene, hexane, dichloromethane, tetrahydrofuran, and acetone. (5pp)

29.02.80 as 025941 (126RH)

Liq. detergent compsn. contains 2 kinds of salt of alkyl ethoxysulphate of formulae R₁O-(CH₂CH₂O)_m-SO₃M (a) and R₂O-(CH₂CH₂O)_n-SO₃M (b) expressed by (a) and (b) and an alkylamine oxide of formula R₃R₄R₅N-O (c), as essential active components, wherein the number of the added ethylene oxide as an average in the mixt. (a) and (b) is 3.5-4.5, the total content of (a) and (b) is 15-25 wt.% based on the amt. of the compsn., and the content of (c) is 2-5 wt.% (where R₁ is 10-15C alkyl; m is 1.5-3.4. M is an alkali metal; R₂ is 10-15C alkyl; n is 4.6-6.5; R₃ is 10-14C alkyl; R₄ and R₅ are 1-4C alkyl). Detergent compsn. has superior detergency and suitability at low temp.. It is suitable as the detergent for vegetables and tablewares. (6pp)

Clothes processing agent for domestic use - comprises water-insoluble compsn. contg. quaternary ammonium salts and ionic surfactant

LION CORP 04.03.80-JP-027124

A97 E19 F06 (28.09.81) D06m-13/46

04.03.80 as 027124 (172GW)

The agent comprises an aq. dispersion of water insol. compsn. which contains (1) mixt. of four types of quat. ammonium salts of formulae (A), (B), (C) and (D) and (2) anionic surfactant in molar ratio of 80:20 to 50:50.

In the formulae, R₁, R₂, R'₁, R'₂ and R'₃ are decyl, dodecenyl or beta-hydroxy-dodecyl gp.; R₃, R₄, R'₄, R'₇, R'₈ and R'₈ are lower alkyl, benzyl gp., (C₂H₄O)_nH or (C₃H₆O)_nH (n and m are 1 to 5); R₅, R₆, R'₅ and R'₆ are 16-18C alkyl, alkenyl or -hydroxyalkyl gp.; X(-), X'(-), Y(-) and Y'(-) are anions. A:B is 98:2-50:50; C:D is 98:2-50:50; A-B:C-D is 30:70-90:10 (by wt.).

(2) consists of polyoxyethylene alkyl sulphate of formula

$R_9O(CH_2CH_2O)_nSO_3(-)Z_1(+)$ or salt thereof or sulphonic acid of formula $R_1O_3SO_3(-)Z_2(+)$ or salt thereof. R_9 is 8-22C alkyl or alkenyl gp.; R_{10} is 8-22C alkyl or monohydroxyalkyl gp.; $Z_1(-)$ and $Z_2(+)$ are H, Li, Na, K, ammonium, alkanolamine or lower alkyl ammonium ion; n is 1 to 5.

The agent imparts slipping property to woven and knitted fabrics made of synthetic fibre and its blend with cotton. (9pp)
